1997 *IEEE Nuclear Science Symposium* Orhan Nalcioglu,1998 *The Theory and Practice of 3D PET* B. Bendriem,D.W. Townsend,2013-06-29 The application of 3D methodology has recently been receiving increasing attention at many PET centres and this monograph is an attempt to provide a state of the art review of this methodology covering 3D reconstruction methods quantitative procedures current tomography performance and clinical and research applications No such review has been available until now to assist PET researchers in understanding and implementing 3D methodology and in evaluating the performance of the available imaging technology In all the chapters the subject matter is treated in sufficient depth to appeal equally to the physicist or engineer who wishes to establish the methodology and to PET investigators with experience in 2D PET who wish to familiarize themselves with the concepts and advantages of 3D and to be made aware of the pitfalls

Handbook of Biomedical Image Analysis David Wilson, Swamy Laxminarayan, 2007-04-25 Our goal is to develop automated methods for the segmentation of the dimensional biomedical images Here we describe the segmentation of confocal microscopy images of bee brains 20 individuals by registration to one or several atlas images Registration is performed by a highly parallel implementation of an entropy based nonrigid registration algorithm using B spline transformations We present and evaluate different methods to solve the correspondence problem in atlas based registration An image can be segmented by registering it to an individual atlas an average atlas or multiple atlases When registering to multiple atlases combining the individual segmentations into a nonsegmentation can be achieved by atlas selection or multiclass iterative decision fusion

We describe all these methods and evaluate these segmentation accuracies that they achieve by performing experiments with electronic phantoms as well as by comparing their outputs to a manual gold standard The present work is focused on the mathematical and computational theory behind a technique for deformable image registration termed Hyperelastic Warping and demonstration of the technique via applications in image registration and strain measurement The approach combines well established principles of nonlinear continuum mechanics with forces derived directly from the dimensional image data to achieve registration The general approach does not require the definition of landmarks, ducts or surfaces although it can accommodate these if available Representative problems demonstrate the robust and flexible nature of the approach Three dimensional registration methods are introduced for registering MRI volumes of the pelvis and prostate The chapter first reviews the applications xi xii Preface challenges and previous methods of image registration in the prostate Analytical
