Modeling and Transformation of Workflows with Temporal Constraints Wolfgang Gruber,2004 Workflow management systems support the execution of business processes they require the modeling of the processes they drive the actual enactment of process

instances and they document the business process execution Many different modeling languages and systems have been developed for the design and representation of business processes and workflows as a consequence of different requirements different purposes as well as different schools and modeling philosophies The differences are partly on a conceptual level in the sense that the modeling languages offer different concepts and constructs and partly on the representation level where basically the same constructs are represented differently e g text or graph based This book makes two important contributions to workflow modeling Firstly it provides a metamodel based on abstract modeling concepts which copes with representation differences of workflow descriptions Secondly it introduces a set of equivalence transformations on workflow models Such transformations are an important tool for workflow developments as they allow representing workflows differently for different purposes These transformations are used in algorithms for checking the satisfiability of temporal constraints in workflow definitions Using this apparatus made it possible to develop a sophisticated time management system for workflows which not only checks temporal constraints but can also be used to develop time plans for workflow execution
