Drug Transporters in Drug Disposition, Effects and Toxicity Xiaodong Liu, Guoyu Pan, 2019-09-30 This book provides with a comprehensive overview of the role of drug transporters in drug disposition and efficacy toxicity as well as drug drug interactions and recent advances in the field Transporters are known determinants of drug disposition and efficacy toxicity In general they are divided into solute carrier SLC and ATP binding cassette ABC families and are located along cell membranes where they mediate drug uptake into cells and export out of cells Drug transporters are essential in maintaining cell homeostasis and their gene mutations may cause or contribute to severe human genetic disorders such as cystic fibrosis neurological disease retinal degeneration anemia and cholesterol and bile transport defects Conversely some diseases may also alter transporter functions and expressions in turn aggravating disease process Further since over expression of some ABC transporters is a potential contributor to multidrug resistance MDR the book presents a number of strategies to overcome MDR including ABC transporter inhibitors and applying epigenetic methods to modulate transporter expressions and functions This book is useful for graduate students and professionals who are looking to refresh or expand their knowledge of this exciting field

Drug Transport Across the Blood-brain Barrier A.G. de Boer, W Sutanto, 1997-04-08 The availability of various in vitro and in vivo techniques has considerably advanced the research on drug transport and metabolism across the blood brain barrier BBB These specialized and sophisticated experimental strategies are of fundamental importance if one is to gain a greater understanding of enhanced and selective drug delivery to the brain The reader will find in this book methods for in vitro

endothelial astrocyte cell culture models and for in vivo intracerebral microdialysis to study drug transport across the BBB. This book however is not merely a laboratory manual consisting of recipes for BBB research; it permits the presentation of the different methods in fine detail, revealing tricks and short cuts that frequently do not appear in the literature. The researcher is well aware that differences, subtle or otherwise, in experimental steps used in different laboratories may influence the outcome of any particular procedure. The book also illustrates the accessibility and the application of the different methods in different species. Background information of the protocol is given in every chapter, which also contains a literature list that the reader may wish to refer to for further information. This volume will be invaluable to basic researchers as well as to those involved in the search for agents suitable for pharmaceutical intervention in the central nervous system. **Drug**

Transporters Glynis Nicholls, Kuresh Youdim, 2016. Understanding and quantifying the effects of membrane transporters within the human body is essential for modulating drug safety and drug efficacy. In this first volume on Drug Transporters, the current knowledge and techniques in the transporter sciences and their relations to drug metabolism and pharmacokinetics are comprehensively reviewed. The second volume of the book is specifically dedicated to emerging science and technologies, highlighting potential areas for future advances within the drug transporter field. The topics covered in both volumes ensure that all relevant aspects of transporters are described across the drug development process, from in silico models and preclinical tools through to the potential impact of transporters in the clinic. Contributions are included from expert leaders in the field, at the bench, industrial scientists, renowned academics, and international regulators. Case studies and emerging developments are highlighted together with the merits and limitations of the available methods and tools, and extensive references to reviews on specific in-depth topics are also included for those wishing to pursue their knowledge further. As such, this text serves as an essential handbook of information for postgraduate students, academics, industrial scientists, and regulators who wish to understand the role of transporters in absorption, distribution, metabolism, and excretion processes. In addition, it is also a useful reference tool on the models and calculations necessary to predict their effect on human pharmacokinetics and pharmacodynamics. Transporters as Drug Carriers Gerhard F. Ecker, Peter Chiba, 2009-09-03. This reference handbook is the first to provide a comprehensive overview, systematically characterizing all known transporters involved in drug elimination and resistance. Combining recent knowledge on all known classes of drug carriers from microbes to man, it begins with a look at human and mammalian transporters. This is followed by microbial, fungal, and parasitic transporters, with special attention given to transport across those physiological barriers relevant for drug uptake, distribution, and excretion. As a result, this key resource lays the foundations for understanding and investigating the molecular mechanisms for multidrug resistance in cancer cells, microbial resistance to antibiotics, and pharmacokinetics in general. For anyone working with antibiotics and cancer chemotherapeutics, as well as being of prime interest to biochemists and biophysicists.

Ocular Transporters in Ophthalmic Diseases and Drug Delivery Joyce Tombran-Tink,Colin J. Barnstable,2008-04-09 Detection and responses to light are common features found throughout the plant and animal kingdoms In most primitive life forms a patch of light sensitive cells make up a region containing a cell sheet devoid of any specialized anatomical structure With the development of the eyes in more advanced life forms light sensing structures became more complex but primitive eyes are still in contiguity with other body tissues and fluids The

evolution of the eyeball promoted an increase in visual acuity and visual processing that in turn allowed vision to become the dominant sensory system for many species including humans. The formation of a totally enclosed structure however required a unique set of solutions to enable the eye to control its environment. Like most organs the eye evolved a series of homeostatic mechanisms to regulate its environment within tightly controlled limits. Unlike most organs however this advanced light sensing structure has a series of requirements that place a tremendous burden on molecules that are responsible for controlling ocular homeostasis. There are many signaling molecules and pathways that work in parallel or through crosstalk to maintain the normal ocular environment required for visual function. Perhaps none are so critical as the group of membrane molecules that are collectively termed transporters. These molecules are responsible for the controlled and selective movements of ions, nutrients and fluid across various ocular layers necessary to optimize the internal milieu to serve visual function.

Evaluation of Drug Candidates for Preclinical Development Chao Han, Charles B. Davis, Binghe Wang, 2010-01-19. Emphasizes the integration of major areas of drug discovery and their importance in candidate evaluation. It is believed that selecting the right drug candidate for development is the key to success. In the last decade pharmaceutical R & D departments have integrated pharmacokinetics and drug metabolism, pharmaceuticals and toxicology into early drug discovery to improve the assessment of potential drug compounds. Now Evaluation of Drug Candidates for Preclinical Development provides a complete view and understanding of why absorption, distribution, metabolism, excretion, toxicology, ADMET plays a pivotal role in drug discovery and development. Encompassing the three major interrelated areas in which optimization and evaluation of drug developability is most critical: pharmacokinetics and drug metabolism, pharmaceuticals and safety assessment, this unique resource encourages integrated thinking in drug discovery. The contributors to this volume cover drug transporters, cytochrome P 450 and drug-drug interactions, plasma protein binding, stability, drug formulation, preclinical safety assessment, toxicology and toxicokinetics. Address developability issues that challenge pharma companies moving beyond isolated experimental results. Reveal connections between the key scientific areas that are critical for successful drug discovery and development. Inspire forward thinking strategies and decision making processes in preclinical evaluation to maximize the potential of drug candidates to progress through development efficiently and meet the increasing demands of the marketplace. Evaluation of Drug Candidates for Preclinical Development serves as an introductory reference for those new to the pharmaceutical industry and drug discovery in particular. It is especially well suited for scientists and management teams in small to mid-sized pharmaceutical companies as well as academic researchers and graduate students concerned with the practical aspects related to the evaluation of drug developability.

Drug Transport(ers) and the Diseased Brain Fundación Dr. Antonio Esteve. Symposium, Albertus G. De Boer, 2005 There are many potent drugs available for many diseases of the brain e.g. Alzheimer's Disease Parkinson's Disease Multiple Sclerosis Stroke Brain tumors. The effectiveness however is not optimal since barriers in the brain prevent the drugs from reaching the brain in sufficient therapeutic concentrations e.g. the blood brain barrier and the blood cerebrospinal fluid barrier. Drug Transporters and the Diseased Brain contains the papers of a timely symposium held in Spain between 6 and 9 October 2004 which sets out not only the point of view of the academic researcher and the clinician but also from the pharmaceutical industrial on how to overcome these barriers and how to treat brain diseases effectively.
