NASA's Astronaut Health Care System United States. Congress. House. Committee on Science and Technology (2007). Subcommittee on Space and Aeronautics, 2008.

Recapturing NASA's Aeronautics Flight Research Capabilities National Research Council, Division on Engineering and Physical Sciences, Aeronautics and Space Engineering Board, Committee to Assess NASA's Aeronautics Flight Research Capabilities, 2012-06-27.

In the five decades since NASA was created, the agency has sustained its legacy from the National Advisory Committee on Aeronautics (NACA) in playing a major role in U.S. aeronautics research and has contributed substantially to United States preeminence in civil and military aviation. This preeminence has contributed significantly to the overall economy and balance of trade of the United States through the sales of aircraft throughout the world. NASA's contributions have included advanced flight control systems, de-icing devices, thrust vectoring systems, wing/fuselage drag reduction configurations, aircraft noise reduction, advanced transonic airfoil and winglet designs, and flight systems. Each of these contributions was successfully demonstrated through NASA flight research programs. Equally important, the aircraft industry would not have adopted these and similar advances without NASA flight demonstration on full-scale aircraft flying in an environment identical to that which the aircraft are to operate in: other words, flight research. Flight research is a tool, not a

conclusion It often informs simulation and modeling and wind tunnel testing Aeronautics research does not follow a linear path from simulation to wind tunnels to flying an aircraft The loss of flight research capabilities at NASA has therefore hindered the agency's ability to make progress throughout its aeronautics program by removing a primary tool for research Recapturing NASA's Aeronautics Flight Research Capabilities discusses the motivation for NASA to pursue flight research addressing the aspects of the committee's task such as identifying the challenges where research program success can be achieved most effectively through flight research The report contains three case studies chosen to illustrate the state of NASA ARMD These include the ERA program and the Fundamental Research Program's hypersonics and supersonics projects Following these case studies the report describes issues with the NASA ARMD organization and management and offers solutions In addition the chapter discusses current impediments to progress including demonstrating relevancy to stakeholders leadership and the lack of focus relative to available resources Recapturing NASA's Aeronautics Flight Research Capabilities concludes that the type and sophistication of flight research currently being conducted by NASA today is relatively low and that the agency's overall progress in aeronautics is severely constrained by its inability to actually advance its research projects to the flight research stage a step that is vital to bridging the confidence gap NASA has spent much effort protecting existing research projects conducted at low levels but it has not been able to pursue most of these projects to the point where they actually produce anything useful Without the ability to actually take flight NASA's aeronautics research cannot progress cannot make new discoveries and cannot contribute to U.S. aerospace preeminence

Prepare for Launch Erik Seedhouse, 2018-10-10 Today's astronauts require many different abilities They must not only be expert in performing flight simulations but must also be proficient in such dissimilar subjects as photography thermodynamics electrical repairs flight procedures oceanography public affairs and geology In Prepare for Launch the author introduces the technologies and myriad activities that constitute or affect astronaut training such as the part task trainers emergency procedures the fixed based and motion based simulators virtual environment training and the demands of training in the Weightless Environment Training Facility With plans to return to the Moon and future missions to Mars the current selection criteria and training are very different from those used for short duration mission Space Shuttle crews Dr Erik Seedhouse in this book focuses on how astronaut candidates are taught to cope with different needs and environments for example hibernation artificial gravity and bioethics issues and also includes brief discussions of the astronaut application and selection process
