Aging And Cell Structure Volume 1:

Aging and Cell Structure John E. Johnson, 2013-11-11 Although thousands of articles and hundreds of books on aging have been published only a small percentage of this material has dealt with anatomy particularly at the fine structural level It was with this in mind that *Aging and Cell Structure* was conceived Volume 1 of *Aging and Cell Structure* was published in 1981 and represented a current compilation of information concentrating at the electron microscopic level on morphological changes which occur in cells and tissues as they age The present volume completes the two volume set While Volume 1 highlighted structural changes occurring in the aging nervous system Volume 2 centers its efforts on studies of in vitro aging Chapters on other subjects are included as well These include age related changes seen in neuromuscular junctions oral tissues and the pancreas Although these two volumes represent a very small part of the published information on experimental gerontology their approach is rather unique because they focus on anatomy perhaps the most basic of all the biomedical sciences Because many different tissue types are examined we begin to see recurrent definitive patterns in the aging cell which may not be fully apparent from studies taking one cell type at a time This becomes even more evident in the present volume where changes seen in populations of cells grown in culture isolated from hormones or nervous impulses from other body areas are found to be similar to those changes found in vivo

Aging and Cell Structure John E. Johnson, 2013-11-21 Approaching any task on aging brings a flood of images that are a personal repetition of what has been one of the greatest and most persistent concerns of mankind Even restricting time to the past decade or so and approaching only the biomedical sciences one still encounters a flood of information in this relatively young research area Theories and ideas abound as though each researcher provides one of his own This might well be expected aging is an exceedingly complicated series of crossroads involving trails and even superhighways Each specialist has a peephole society body organ tissue cell or especially in modern biology cellular organelles macromolecules and even molecules and the views of the crossroads are obviously different Hence the number of observations just about equals the number of independent ideas put forward It is natural to seek from highly specialized knowledge a fundamental understanding of aging through the modern research trends in biology that focus on events at the cellular subcellular macromolecular and molecular levels The ultimate clues must lie there with one serious complication There are numerous cell types in any body and each cell type is a very complex machine of its own Additionally there are potential repercussions in that different cells tissues and even molecules have effects on one another This is indeed a confusing situation and one for which we must seek reliable answers provided that we can take a step back and provide a generalized view

Aging and cell structure John E. Johnson, 1981 **Aging and Cell Structure** John E. Johnson, 1981 **Aging and Cell Structure** John E. Johnson, 1981-12-31 Approaching any task on aging brings a flood of images that are a personal repetition of what has been one of the greatest and most persistent concerns of mankind Even restricting time to the past decade or so and approaching only the biomedical sciences one still

encounters a flood of information in this relatively young research area. Theories and ideas abound as though each researcher provides one of his own. This might well be expected: aging is an exceedingly complicated series of crossroads involving trails and even superhighways. Each specialist has a peephole: society, body, organ, tissue, cell, or especially in modern biology, cellular organelles, macromolecules, and even molecules, and the views of the crossroads are obviously different. Hence the number of observations just about equals the number of independent ideas put forward. It is natural to seek from highly specialized knowledge a fundamental understanding of aging through the modern research trends in biology that focus on events at the cellular, subcellular, macromolecular, and molecular levels. The ultimate clues must lie there with one serious complication. There are numerous cell types in any body and each cell type is a very complex machine of its own. Additionally, there are potential repercussions in that different cells, tissues, and even molecules have effects on one another. This is indeed a confusing situation and one for which we must seek reliable answers provided that we can take a step back and provide a generalized view.

Structural Elements of the Nervous System Abel Lajtha, 2013-03-09 Neurochemistry having the objective of elucidating biochemical processes subserving nervous activity emerged as an application of chemistry to the of neurobiological problems as a post World War II phenomenon investigation. However, only in the last 40 years has the chemical community recognized neurochemistry as a distinct if hybrid discipline. During this period great strides have been made. However, recently neurochemistry along with neurophysiology, neuropharmacology, neuroanatomy, and the behavioral sciences has emerged to form neuroscience, a new community of scientists with its own national society, journals, and meetings. Actually, this recently formed hybrid neuroscience is in the process of merging with another well-established discipline, molecular genetics, frequently called molecular biology, and itself a hybrid which appears to have sufficient hybrid vigor to form yet a new community of scientists which for want of a more imaginative term has been called molecular genetic neuroscience. Clearly, advantages resulting from such mergers or hybridizations accrue not only from the merging discipline, neurochemistry, in this case to the new community, molecular genetic neuroscience, but also in the reverse direction. This Foreword will be concerned primarily with examples of this latter process.

Principles and Practice of Geriatric Surgery Ronnie Ann

Rosenthal, Michael E. Zenilman, Mark R. Katlic, 2013-06-29 More than two decades ago in response to the special healthcare needs of the aging American population, interest in the field of geriatric medicine began to grow and blossom in the United States. In 1984 and 1985, under the editorial leadership of Christine K. Cassel and William R. Hazzard, respectively, two major textbooks devoted to the medical care of aged patients were published. These scholarly, comprehensive texts provided insight into the principles of aging and guidance in the care of the geriatric patient. Three editions later, the need to understand the special issues involved in the medical care of the elderly is widely accepted by internists, primary care providers, and medical specialists. For the editors of this book, the special issues involved in the surgical care of the elderly have been apparent for

nearly as long Although there have been a few scholarly texts on the subject including one in 1990 by Mark R Katlic general acceptance of the concept of geriatric surgery by our surgical and medical colleagues has however lagged This is not the result of a proportionately smaller number of older patients with surgical disease because cancer cardiovascular disease and orthopedic problems are diseases of the aged It is rather the result of uncertainty about the value of surgery in the elderly and concerns about the risks of operations In the past such concerns prevented primary care givers from referring patients for surgical care and prevented surgeons from agreeing to operate Cerebral Cortex Alan Peters,Edward G.

Jones,2013-11-11 This volume of the series on Cerebral Cortex deals with a variety of topics that need to be considered in our overall understanding of the functions of the cerebral hemispheres Chapters in the first part of this volume deal with normal functions that were not covered in earlier volumes while chapters in the latter part deal with the functioning of the cortex in various altered states The first chapter is by Eberhard Fetz Keisuke Toyama and Wade Smith and it considers the interactions that can be demonstrated to exist between cortical neurons by using the technique of cross correlation The second chapter is by Brent Vogt who examines the connections and functions of layer I of the cerebral cortex a layer that has been largely ignored in the past and he proposes that this layer probably plays an important role in learning and memory acquisition This is followed by a chapter in which Oswald Steward presents a review of what is currently known about synaptic replacement following denervation of cortical neurons and especially those in the hippocampus
