Optimizing the Delivery of Multiple Ecosystem Goods and Services in Agricultural Systems Maria A. Tsiafouli,Evangelia G. Drakou,Alberto Orgiazzi,Katarina Hedlund,Karl Ritz,2017-10-18 Agricultural land is subjected to a variety of societal pressures as demands for food animal feed and biomass production increase with an added requirement to simultaneously maintain natural areas and mitigate climatic and environmental impacts The biotic elements of agricultural systems interact with the abiotic environment to generate a number of ecosystem functions that offer services benefiting humans across many scales of time and space The intensification of agriculture generally reduces biodiversity including that within soil and impacts negatively upon a number of regulating and supporting ecosystem services There is a global need toward achieving sustainable agricultural systems as also highlighted in the United Nations Sustainable Development Goals There is hence a need for management regimes that enhance both agricultural production and the associated provision of multiple ecosystem services The articles of this Research Topic enhance our knowledge of how management practices applied to agricultural systems affect the delivery of multiple ecosystem services and how trade offs between provisioning regulating and supporting services can be handled both above and below ground They also show the diversity of topics that need to be considered within the framework of ecosystem services delivered by agricultural systems from knowledge on basic concepts and newly proposed frameworks to a focus on specific ecosystem types such as grasslands and high nature value farmlands pollinator habitats and soil habitats This diversity of topics indicates the need for broader scope research integrated with targeted scientific research to promote sustainable agricultural practices and to ensure food security

Routledge Handbook of Water Economics and Institutions Kimberly Burnett,Richard Howitt,James A. Roumasset,Christopher A. Wada,2014-12-05 Growing scarcity of freshwater worldwide brings to light the need for sound water resource modeling and

policy analysis While a solid foundation has been established for many specific water management problems combining those methods and principles in a unified framework remains an ongoing challenge This Handbook aims to expand the scope of efficient water use to include allocation of sources and quantities across uses and time as well as integrating demand management with supply side substitutes Socially efficient water use does not generally coincide with private decisions in the real world however Examples of mechanisms designed to incentivize efficient behavior are drawn from agricultural water use municipal water regulation and externalities linked to water resources Water management is further complicated when information is costly and or imperfect Standard optimization frameworks are extended to allow for coordination costs games and cooperation and risk allocation When operating efficiently water markets are often viewed as a desirable means of allocation because a market price incentivizes users to move resources from low to high value activities However early attempts at water trading have run into many obstacles Case studies from the United States Australia Europe and Canada highlight the successes and remaining challenges of establishing efficient water markets
