

Agricultural Biotechnology and Poverty Reduction in Low-income Countries

GREGORY GRAFF, DAVID ROLAND-HOLST and DAVID ZILBERMAN^{*}
University of California at Berkeley, USA

Summary. — While biotechnology innovation is concentrated in high income, “Tier I” countries, international diffusion of innovations to improve the diet, health, and incomes of the poorest will be largely driven by “Tier II” innovators such as China and Brazil. Adoption of beneficial biotechnologies in “Tier II” and “Tier III” countries will increase as more transgenic versions of conventionally grown varieties become available and as costs decline, which in turn will depend upon regulatory approvals being needed only once for each transformation event and transaction costs for accessing technologies being minimized. Investments in higher education and intellectual property clearinghouse institutions can greatly facilitate technology transfer.

1. INTRODUCTION AND BACKGROUND

Economic history can be read as a testament to the transformative power of technology in relation to the human condition (Rosenberg, 1982). The older part of this testament tells of a progression from hunting to farming to military technologies, while the newer part begins when mechanization and fossil fuels were enlisted for industrial production. Across the entire chronicle, we see the catalyst that technology has been for economic growth, improvement of human welfare, and alleviation of poverty. Using energy-intensive mechanical technologies, we have achieved living standards for hundreds of millions of people around the globe that are beyond the imagination of prior generations (Bresnahan & Gordon, 1997). Yet, despite raising average standards of living, technology has not eliminated poverty.

World Bank (2000) estimated that in 1998, 56% of humanity lived on less than \$2 a day and 24% subsisted on less than \$1 a day. Detailed analyses of poverty¹ reveal that entry into this status and exit from it are asymmetric, yet share some important characteristics. A primary reason for a household falling into poverty is an adverse health event,² including mortality. On the upside, the main determinant

of a transition from poverty to non-poverty is (formal and informal) employment. In both cases, health status is critical, directly with respect to downside poverty risk and indirectly in terms of fitness for labor recruitment and productivity.

Biotechnology has the potential to improve living standards in low-income countries. Applications of biotechnology can increase food output, improve nutritional quality, and raise health status. Although it remains an area of controversy, biotechnology has already achieved significant productivity gains and improvement in health status of farm workers (Huang, Hu, Rozelle, & Pray, 2005; Pray, Huang, Hu, & Rozelle, 2002). Somewhat less controversially, genetic biofortification of food crops is poised as a biologically and economically effective approach to widespread alleviation of micronutrient deficiencies (Albrecht, 2002; Bouis, 2004). Less controversially still, biotechnology has certainly begun to alter the landscape of preventative and therapeutic medicine, and additionally it is beginning to enlist food and agriculture in ever more creative ways to prevent and treat disease, including naturally
