Interfacial phenomena are commonplace in physics chemistry biology and in various disciplines bridging these fields They occur whenever a continuum is present which can exist in at least two different chemical or physical states and there is some mechanism which generates or enforces a spatial separation between these states The separation boundary is then called an interface In the examples studied here the separation boundary and its internal structure result from the balance between two opposing tendencies a diffusive effect which attempts to mix and smooth the properties of the material and a physical or chemical mechanism which works to drive it to one or the other pure state This volume is unique in that the treatment of flames as well as internal layer dynamics including curvature effects is more detailed and systematic than in publications
