Biological Models in Radiopharmaceutical Development R.M. Lambrecht,2012-12-06 Radiophannaceuticals labeled with short lived radionuclides are utilized to unravel biochemical processes and to diagnosis and treat diseases of the living body are developed through extensive evaluation in iological models fhC first attempt to compile information was a volume entitled ANIMAL MODELS IN RADIOTRACER DESIGN that was edited by William C Eckelman and myself in 1983 The volume had a focus on the animal models that investigators were using in order to design radiotracers that displayed in vivo selectivity as measured by biodistribution and pharmacokinetic studies A concern in the early days of nuclear medicine was species differences Often a series of labeled compounds were evaluated in a several different animal models in order to gain confidence that the selected radiotracer would behave appropriately in humans During the past 12 years there have been remarkable advances in molecular genetics molecular biology synthetic radiopharmaceutical chemistry molecular modeling and visualization and emission tomography Biological models can now be selected that are better defined in terms of molecular aspects of the disease process The development of high resolution PET and SPET for clinical applications facilitates the development of new radiopharmaceuticals by the use of models to quantitatively evaluate drug effects and progression of disease and hence to arrive at better diagnosis and treatments for animals and humans With these advances there is an effective use of biological models and the refinement of alternatives for the development of new

Cystic Fibrosis Club. Meeting,1984 Electron Probe Microanalysis Karl Zierold,Herbert K. Hagler,2013-03-08 The aim of electron probe microanalysis of biological systems is to identify localize and quantify elements mass and water in cells and tissues The method is based on the idea that all electrons and photons emerging from an electron beam irradiated specimen contain information on its structure and composition In particular energy spectroscopy of X rays and electrons after interaction of the electron beam with the specimen is used for this purpose However the application of this method in biology and medicine has to overcome three specific problems 1 The principle constituent of most cell samples is water Since liquid water is not compatible with vacuum conditions in the electron microscope specimens have to be prepared without disturbing the other components in parti cular diffusible ions elements 2 Electron probe microanaly sis provides physical data on either dry specimens or fully hydrated frozen specimens This data usually has to be con verted into quantitative data meaningful to the cell biologist or physiologist 3 Cells and tissues are not static but dynamic systems Thus for example microanalysis of physiolo gical processes requires sampling techniques which are adapted to address specific biological or medical questions During recent years remarkable progress has been made to overcome these problems Cryopreparation image analysis and electron energy loss spectroscopy are key areas which have solved some problems and offer promise for
