Androgens and Androgen Receptor Signalling in Men Eleanor Frances Need, 2008 Androgens are critical for the development and maintenance of adult male characteristics such as muscle mass and sexual function Consequently the established decline with age of serum testosterone T in males has major health implications While the androgen receptor AR is the major mediator of genomic androgen action and is required for the development of the male phenotype reproductive organs and the maintenance of male secondary sexual characteristics it is the entrance of androgens into the cell that mediates the activation of the AR and the subsequent modulation of expression of androgen regulated genes The objectives of this thesis were to develop a specific mammalian cell based bioassay capable of reliably measuring T in serum and to determine the ability of this bioassay to measure a physiologically relevant fraction of T in serum Additionally this thesis aimed to determine the relative contributions and roles of the activation functions of the AR to overall AR transcriptional activity along with the functional consequences for AR signalling of prostate cancer mutations which have previously been identified in the AF5 region of the AR NTD The investigation of the roles of the activation functions in the AR in this thesis have revealed that while the AF1 domain is responsible for the majority of the transactivation activity of the AR AF5 and AF2 govern the sensitivity and cellular response

of the AR to androgens by providing protein and interdomain interaction interfaces Furthermore the evidence in this thesis demonstrates that the AR requires interdomain communication for sensitive AR signalling Finally the findings in this thesis demonstrate that the AF5 surface is required for the N C interaction and coregulator interactions while advanced prostate cancer mutations identified within this region confer increased transactivation activity of the AR in the presence of high cellular levels of coregulators Collectively the findings in this thesis provide several novel insights into the mechanism of action of serum androgens and challenges several long held assumptions of androgenic action in males These findings also delineate a mechanism of treatment failure in advanced prostate cancer provide a novel model for the events leading to sensitive AR transactivation and contribute to the understanding of physiologically relevant levels of serum T

Tindall,James Mohler,2009-04-20 Androgens are critical regulators of prostate differentiation and function as well as prostate

cancer growth and survival Therefore androgen ablation is the preferred systemic treatment for disseminated prostate cancer Androgen action is exerted in target tissues via binding the androgen receptor AR a nuclear receptor transcription factor Historically the gene expression program mediated by the AR has been poorly understood However recent gene expression profiling and more traditional single gene characterization studies have revealed many androgen regulated genes that are important mediators of androgen action in both normal and malignant prostate tissue This book will focus on the androgen regulated gene expression program and examine how recently identified androgen regulated genes are likely to contribute to the development and progression of prostate cancer Recent studies that have attempted to unravel how these genes are deregulated in androgen depletion independent prostate cancer will be included **Encyclopedia of Stress**

Vasconsuelo,2019-06-03 This monograph focuses on the actions exerted by sex hormones 17 estradiol and testosterone in skeletal muscle tissue An important consideration of this volume is the fact that both estrogen receptors ERs and androgen

receptors ARs are ubiquitously expressed and as a result steroid hormones affect growth and different cell functions in several organs Moreover ERs and ARs may have a non classical pattern of intracellular localizations raising complexity to the functional roles of estradiol and testosterone Readers will find key information about the role of sex hormones in mitochondrial physiology and their relation with ageing apoptosis and sarcopenia Chapters integrate important points with the latest information on the subject including work of leading researchers studying the cellular and molecular mechanisms underlying the age linked changes in muscle tissue while highlighting the role of satellite cells Furthermore the book presents a chapter about phytoestrogens compounds which are structurally very similar to estrogen 17 estradiol and their selective action on sex steroid receptors specifically they have a higher affinity for ER receptors than ER receptors The book is recommended reading for scientists and clinicians involved in the field of medical and health sciences as well as for scholarly readers students of biochemistry and medicine who are interested in the molecular mechanism of cellular apoptosis regulated by steroid hormones
