Ecosystem Dynamics in the Eastern Bering Sea T. Laevastu,1979 **Ecosystem Based Management for Marine Fisheries** Andrea Belgrano,Charles W. Fowler,2011-02-03 Showing how big picture patterns can help overcome the failures of conventional management this book is ideal for students researchers and professionals involved with marine fisheries It explores not only the current practice of the ecosystem approach to fisheries management but also its critical importance to even larger perspectives The first section gives a valuable overview of how more and more of the complexity of real world systems is being recognized and involved in the management of fisheries around the world The second section then demonstrates how important aspects of real world systems involving population dynamics evolution and behavior remain to be taken into account completely This section also shows how we must change the way we think about our involvement in and the complexity of marine ecosystems The final chapters consider how with the use of carefully chosen macroecological patterns we can take important steps towards more holistic management of marine fisheries **Responsible Fisheries in the Marine Ecosystem** Michael Sinclair,Grimur Valdimarsson,2014-05-28 This book addresses ecological and environmental issues associated with responsible and sustainable marine fisheries It includes 22 chapters and has been developed from the Conference on Responsible Fisheries in the Marine Ecosystem held in Iceland in October 2001 Contents include a global overview of marine capture fisheries legal protection for marine ecosystems dynamics of marine ecosystems the role of man in marine ecosystems and incorporating ecosystem considerations in fisheries management The book has a subject index **Ecological Studies on the Ecosystem of the Bering Sea** ,1982 The Southeast Bering Sea Ecosystem G. L. Hunt,NOAA Coastal Ocean Program (U.S.),2004 **Reality-based Marine Protected Areas for the Eastern Bering Sea** Charles Winsor Fowler,L. K. Johnston,2015 In this paper we present another example of finding holistic guidance for systemic management in this case it involves defining the portion of ecosystems to be established as protected areas As in previous cases reality based management is carried out by mimicking natural examples of sustainability Although our emphasis is on marine protected areas MPAs the approach is one that can be applied in the protection of any area or ecosystem on the planet To provide a specific example we have chosen the eastern Bering Sea ecosystem and the management of fisheries in regard to MPAs Thus the management questions that can be addressed are exemplified by What portion of the eastern Bering Sea ecosystem should be designated as areas where fishing is prohibited For this example the consonant research question to guide the relevant science is What portion of the eastern Bering Sea ecosystem are areas where each species of marine mammal does not consume resources Answering this question we quantitatively characterize natural patterns of sustainability both within the greater eastern Bering Sea ecosystem as well as for 21 smaller ecosystems These patterns provide guidance for the holistic reality based and sustainable management of fisheries involving the portion

of each ecosystem to be closed to fishing. Similar patterns for other areas in either marine or terrestrial settings would be used for guidance of the kind found within this study. We conclude that roughly 33% of each of the marine ecosystems in our study should be placed in protected status designated as MPAs. However, based on the likelihood of a broader pattern, it appears that the portion of an ecosystem to be set aside in sustainable protected status depends on the size of the ecosystem; it will probably be found advisable to set aside larger portions of larger ecosystems. Another natural pattern indicates that for the eastern Bering Sea, setting aside one single area in protected status would likely suffice. We also conclude that a far more necessary measure in fisheries management in this ecosystem would be the reduction of harvest rates, even though establishing MPAs remains as a crucial part of fisheries management. The pattern-based options for the portion of the eastern Bering Sea ecosystem to be set aside as MPAs are quite broad and do not reveal any notable abnormality in current fisheries management. In contrast, reality-based patterns in consumption rates among other species of mammals occupying this ecosystem indicate that current harvest rates are very abnormal and large reductions in harvest rates are needed in our take from individual species, species groups, and the entire ecosystem in order to achieve sustainability. Current harvest rates as considered in conventional management practices and based on necessarily incomplete data are all obviously abnormal, unsustainable, in parallel with many other aspects of current forms of management. Further research is needed to specify, reveal, and characterize the consonant patterns that will provide information for holistic guidance for the specific timing and precise location of MPAs where fishing would be prohibited in the eastern Bering Sea. doi:10.7289/V55H7D7K <http://dx.doi.org/10.7289/V55H7D7K>
