 recombinant DNA technology DNA cloning molecular cloning or gene cloning all refer to the same process the transfer of a  
 DNA fragment of interest from one organism to a self replicating genetic element such as a bacterial plasmid The DNA of  
 interest can then be propagated in a foreign host cell This technology has been around since the 1970s and it has become a  
 common practice in molecular biology labs today Reproductive cloning is a technology used to generate an animal that has  
 the same nuclear DNA as another currently or previously existing animal Dolly was created by reproductive cloning  
 technology In a process called somatic cell nuclear transfer SCNT scientists transfer genetic material from the nucleus of a  
 donor adult cell to an egg whose nucleus and thus its genetic material has been removed The reconstructed egg containing  
 the DNA from a donor cell must be treated with chemicals or electric current in order to stimulate cell division Once the  
 cloned embryo reaches a suitable stage it is transferred to the uterus of a female host where it continues to develop until  
 birth Therapeutic cloning also called embryo cloning is the production of human embryos for use in research The goal of this  
 process is not to create cloned human beings but rather to harvest stem cells that can be used to study human development  
 and to treat disease Stem cells are important to biomedical researchers because they can be used to generate virtually any  
 type of specialised cell in the human body This new book presents an up to date Chronology of Cloning along with current
