Automated Deduction in

Classical and Non-Classical Logics Ricardo Caferra, Gernot Salzer, 2000-02-09 This volume presents a collection of thoroughly reviewed revised full papers on automated deduction in classical modal and many valued logics with an emphasis on first order theories Five invited papers by prominent researchers give a consolidated view of the recent developments in first order theorem proving The 14 research papers presented went through a twofold selection process and were first presented at the International Workshop on First Order Theorem Proving FTP 98 held in Vienna Austria in November 1998 The contributed papers reflect the current status in research in the area most of the results presented rely on resolution or tableaux methods with a few exceptions choosing the equational paradigm **Classical vs non-classical logics** Dov M. Gabbay, 1993

Neural-Symbolic Cognitive Reasoning Artur S. D'Avila Garcez, Luís C. Lamb, Dov M. Gabbay, 2009 This book explores why regarding practical reasoning humans are sometimes still faster than artificial intelligence systems It is the first to offer a self contained presentation of neural network models for many computer science logics *Alasdair*

Urquhart on Nonclassical and Algebraic Logic and Complexity of Proofs Ivo Düntsch, Edwin Mares, 2021-09-24 This book is dedicated to the work of Alasdair Urquhart The book starts out with an introduction to and an overview of Urquhart's work and an autobiographical essay by Urquhart This introductory section is followed by papers on algebraic logic and lattice theory papers on the complexity of proofs and papers on philosophical logic and history of logic The final section of the book contains a response to the papers by Urquhart Alasdair Urquhart has made extremely important contributions to a variety of fields in logic He produced some of the earliest work on the semantics of relevant logic He provided the undecidability of the logics R of relevant implication and E of relevant entailment as well as some of their close neighbors He proved that interpolation fails in some of those systems Urquhart has done very important work in complexity theory both about the complexity of proofs in classical and some nonclassical logics In pure algebra he has produced a representation theorem for lattices and some rather beautiful duality theorems In addition he has done important work in the history of logic especially on Bertrand Russell including editing Volume four of Russell's Collected Papers **Logics for Computer Science** Anita

Wasilewska, 2018-11-03 Providing an in depth introduction to fundamental classical and non classical logics this textbook offers a comprehensive survey of logics for computer scientists Logics for Computer Science contains intuitive introductory chapters explaining the need for logical investigations motivations for different types of logics and some of their history They are followed by strict formal approach chapters All chapters contain many detailed examples explaining each of the introduced notions and definitions well chosen sets of exercises with carefully written solutions and sets of homework While many logic books are available they were written by logicians for logicians not for computer scientists They usually choose one particular way of presenting the material and use a specialized language Logics for Computer Science discusses Gentzen as well as Hilbert formalizations first order theories the Hilbert Program Godel's first and second incompleteness theorems and their proofs It also introduces and discusses some many valued logics modal logics and introduces algebraic models for

classical intuitionistic and modal S4 and S5 logics The theory of computation is based on concepts defined by logicians and mathematicians Logic plays a fundamental role in computer science and this book explains the basic theorems as well as different techniques of proving them in classical and some non classical logics Important applications derived from concepts of logic for computer technology include Artificial Intelligence and Software Engineering In addition to Computer Science this book may also find an audience in mathematics and philosophy courses and some of the chapters are also useful for a course in Artificial Intelligence

Rationality and Logic Robert Hanna, 2009-01-23 An argument that logic is intrinsically psychological and human psychology is intrinsically logical and that the connection between human rationality and logic is both constitutive and mutual In Rationality and Logic Robert Hanna argues that logic is intrinsically psychological and that human psychology is intrinsically logical He claims that logic is cognitively constructed by rational animals including humans and that rational animals are essentially logical animals In order to do so he defends the broadly Kantian thesis that all and only rational animals possess an innate cognitive logic faculty Hanna's claims challenge the conventional philosophical wisdom that sees logic as a fully formal or topic neutral science irreconcilably separate from the species or individual specific focus of empirical psychology Logic and psychology went their separate ways after attacks by Frege and Husserl on logical psychologism the explanatory reduction of logic to empirical psychology Hanna argues however that despite the fact that logical psychologism is false there is an essential link between logic and psychology Rational human animals constitute the basic class of cognizers or thinkers studied by cognitive psychology given the connection between rationality and logic that Hanna claims it follows that the nature of logic is significantly revealed to us by cognitive psychology Hanna's proposed logical cognitivism has two important consequences the recognition by logically oriented philosophers that psychologists are their colleagues in the metadiscipline of cognitive science and radical changes in cognitive science itself Cognitive science Hanna argues is not at bottom a natural science it is both an objective or truth oriented science and a normative human science as is logic itself

Handbook of Quantum Logic and Quantum Structures Kurt Engesser, Dov M. Gabbay, Daniel Lehmann, 2011-08-11 Since its inception in the famous 1936 paper by Birkhoff and von Neumann entitled The logic of quantum mechanics quantum logic i.e. the logical investigation of quantum mechanics has undergone an enormous development Various schools of thought and approaches have emerged and there are a variety of technical results Quantum logic is a heterogeneous field of research ranging from investigations which may be termed logical in the traditional sense to studies focusing on structures which are on the border between algebra and logic For the latter structures the term quantum structures is appropriate The chapters of this Handbook which are authored by the most eminent scholars in the field constitute a comprehensive presentation of the main schools approaches and results in the field of quantum logic and quantum structures Much of the material presented is of recent origin representing the frontier of the subject The present

volume focuses on quantum structures Among the structures studied extensively in this volume are just to name a few Hilbert lattices D posets effect algebras MV algebras partially ordered Abelian groups and those structures underlying quantum probability Written by eminent scholars in the field of logic A comprehensive presentation of the theory approaches and results in the field of quantum logic Volume focuses on quantum structures

Quantification in Nonclassical Logic Dov M. Gabbay, Dimitrij Skvortsov, Valentin Shehtman, 2009-06-20 Quantification and modalities have always been topics of great interest for logicians These two themes emerged from philosophy and language in ancient times they were studied by traditional informal methods until the 20th century In the last century the tools became highly mathematical and both modal logic and quantification found numerous applications in Computer Science At the same time many other kinds of nonclassical logics were investigated and applied to Computer Science Although there exist several good books in propositional modal logics this book is the first detailed monograph in nonclassical first order quantification It includes results obtained during the past thirty years The field is very large so we confine ourselves with only two kinds of logics modal and superintuitionistic The main emphasis of Volume 1 is model theoretic and it concentrates on descriptions of different sound semantics and completeness problem even for these seemingly simple questions we have our hands full The major part of the presented material has never been published before Some results are very recent and for other results we either give new proofs or first proofs in full detail

Hume's Problem Solved Gerhard Schurz, 2019-05-07 A new approach to Hume's problem of induction that justifies the optimality of induction at the level of meta induction Hume's problem of justifying induction has been among epistemology's greatest challenges for centuries In this book Gerhard Schurz proposes a new approach to Hume's problem Acknowledging the force of Hume's arguments against the possibility of a noncircular justification of the reliability of induction Schurz demonstrates instead the possibility of a noncircular justification of the optimality of induction or more precisely of meta induction the application of induction to competing prediction models Drawing on discoveries in computational learning theory Schurz demonstrates that a regret based learning strategy attractivity weighted meta induction is predictively optimal in all possible worlds among all prediction methods accessible to the epistemic agent Moreover the a priori justification of meta induction generates a noncircular a posteriori justification of object induction Taken together these two results provide a noncircular solution to Hume's problem Schurz

discusses the philosophical debate on the problem of induction addressing all major attempts at a solution to Hume's problem and describing their shortcomings presents a series of theorems accompanied by a description of computer simulations illustrating the content of these theorems with proofs presented in a mathematical appendix and defends, refines and applies core insights regarding the optimality of meta-induction explaining applications in neighboring disciplines including forecasting sciences cognitive science social epistemology and generalized evolution theory Finally Schurz generalizes the method of optimality based justification to a new strategy of justification in epistemology arguing that optimality justifications can avoid the problems of justificatory circularity and regress
