Handbook of Biomedical Image Analysis David Wilson, Swamy Laxminarayan, 2007-04-25 Our goal is to develop automated methods for the segmentation of the dimensional biomedical images Here we describe the segmentation of confocal microscopy images of bee brains 20 individuals by registration to one or several atlas images Registration is performed by a highly parallel implementation of an entropy based nonrigid registration algorithm using B spline transformations We present and evaluate different methods to solve the correspondence problem in atlas based registration An image can be segmented by registering it to an individual atlas an average atlas or multiple atlases When registering to multiple atlases combining the individual segmentations into a single segmentation can be achieved by atlas selection or multiclass iterative decision fusion We describe all these methods and evaluate these segmentation accuracies that they achieve by performing experiments with electronic phantoms as well as by comparing their outputs to a manual gold standard The present work is focused on the mathematical and computational theory behind a technique for deformable image registration termed Hyperelastic Warping and demonstration of the technique via applications in image registration and strain measurement The approach combines well established principles of nonlinear continuum mechanics with forces derived directly from the dimensional image data to achieve registration The general approach does not require the definition of landmarks, ducts or surfaces although it can accommodate these if available Representative problems demonstrate the robust and flexible nature of the approach Three dimensional registration methods are introduced for registering MRI volumes of the pelvis and prostate The chapter first reviews the applications xi xii Preface challenges and previous methods of image registration in the prostate **Analytical**
