Algebra Computer Masters:

Computing in Algebraic Geometry Wolfram Decker, Christoph Lossen, 2006-03-02 This book provides a quick access to computational tools for algebraic geometry the mathematical discipline which handles solution sets of polynomial equations Originating from a number of intense one week schools taught by the authors the text is designed so as to provide a step by step introduction which enables the reader to get started with his own computational experiments right away The authors present the basic concepts and ideas in a compact way **Algebra**, 1996 **Learn from the Masters!** Frank Swetz, 1995

This book is for high school and college teachers who want to know how they can use the history of mathematics as a pedagogical tool to help their students construct their own knowledge of mathematics Often a historical development of a particular topic is the best way to present a mathematical topic but teachers may not have the time to do the research needed to present the material This book provides its readers with historical ideas and insights which can be immediately applied in the classroom The book is divided into two sections the first on the use of history in high school mathematics and the second on its use in university mathematics The articles are diverse covering fields such as trigonometry mathematical modeling calculus linear algebra vector analysis and celestial mechanics Also included are articles of a somewhat philosophical nature which give general ideas on why history should be used in teaching and how it can be used in various special kinds of courses Each article contains a bibliography to guide the reader to further reading on the subject **Master**

issue of derivatives documentation when writing my diploma thesis on measuring the credit risk of OTC derivatives while I

was an economics student at the University of Bonn Despite the fact that security design has been an area of research in economics for many years and despite the widespread use of derivatives documentation in financial practice the task of designing contracts for derivatives transactions has not been dealt with in financial theory The one thing that aroused my curiosity was that two parties with usually opposing interests namely banking supervisors and the banking industry s lobby unanimously endorse the use of certain provisions in standardized contracts called master agreements Do these provisions increase the ex ante efficiency of contracts for all parties involved I actually began my research expecting to find support for the widely held beliefs about the efficiency or inefficiency of certain provisions and was surprised to obtain results that contradicted the conventional wisdom I would strongly advise against using these results in any political debate on derivatives documentation They were obtained within a highly stylized model with some restrictive assumptions This work should rather be seen as an attempt to formalize the discussion on derivatives documentation and to challenge the notion that certain provisions are generally ex ante efficient It is also an invitation to all those advocating the use of certain provisions in master agreements to formalize their arguments and to explain the economic rationale behind these provisions
