Sulfur Metabolism in Phototrophic Organisms Rüdiger Hell, Christiane Dahl, David B. Knaff, Thomas Leustek, 2008-03-19 Sulfur is one of the most versatile elements in life due to its reactivity in different oxidation and reduction states In phototrophic organisms the redox properties of sulfur in proteins and of sulfur containing metabolites are particularly important in the interaction between the reductive assimilation processes of photosynthesis and reactive oxygen species that arise as by products of electron transport chains Thiol groups in proteins and metabolites are targets of reactive oxygen species resulting in potential damage and at the same time giving rise to redox signal cascades that trigger repair reactions and adaptation to environmental stress Further reduced sulfur compounds play a prominent role as electron donors for photosynthetic carbon dioxide fixation in anoxygenic phototrophic sulfur bacteria Interest in the investigation of the multiple functions of sulfur related processes has increased exponentially in recent years especially in molecular and cellular biology biochemistry agrobiotechnology and ecology This book provides for the first time in depth and integrated coverage of the functions of sulfur in phototrophic organisms including bacteria plants and algae it bridges gaps between biochemistry and cellular biology of sulfur in these organisms and of biology and environments dominated by them This book is designed to be a comprehensive resource on sulfur in phototrophic organisms for advanced undergraduate and graduate students beginning researchers and teachers in the area of photosynthesis bacterial energy metabolism biotechnology plant nutrition plant production and plant molecular physiology

Acetic Acid Bacteria Kazunobu Matsushita, Hirohide Toyama, Naoto Tonouchi, Akiko Okamoto-Kainuma, 2016-06-14 This book provides all facets of acetic acid bacteria AAB and offers the future targets and directions of AAB research. It summarizes the distinctive physiological properties of AAB and the recent progress on AAB study especially in the following five areas: 1. Molecular phylogeny and genome study of AAB; 2. Ecological features of AAB interaction with plants, natural fermentation systems and insects; 3. Physiological features and living strategies of AAB including rapid oxidation ability, acid resistance, biofilm formation and genetic instability; 4. Molecular mechanisms of several oxidative fermentations such as acetate fermentation, sorbose fermentation and ketogluconate fermentation; 5. Recent biotechnological aspects of AAB biocatalysts, biosensors, biocellulose and other useful polysaccharides. AAB research has a long history since the discovery of AAB by Louis Pasteur and the identification of AAB by Martinus Beijerinck in the nineteenth century. In the twentieth century, basic research on the taxonomic study of AAB and on biochemical study for the unique oxidative reactions of AAB had progressed as well as the industrial application of AAB not only in vinegar fermentation but also in the bioconversion process for useful chemical or pharmaceutical products. Entering the twenty-first century, AAB research has expanded more and further progress is expected to be seen in all fields of AAB classification and ecology, physiology and biochemistry, genetics and biotechnology of vinegar fermentation and other oxidative fermentations. Far-reaching development in the last decade makes these bacteria more valuable for various industrial uses. Readers can obtain useful and comprehensive information which is exciting in aspects of basic science and provides hints for the better application of these bacteria to various kinds of practical production scenarios as well.

Halophiles Dinesh K Maheshwari, Meenu Saraf, 2015-09-16 The world of halophiles is quite diverse and their representatives in three domains of life, i.e. archaea, bacteria and eukarya. They are found all over the small subunit rRNA based tree of life and these microorganisms are adapted to salt concentration up to saturation, hence able to grow at 300g/l NaCl concentration. Their metabolic diversity is high as well encompassing oxygenic and anoxygenic phototrophs, aerobic heterotrophs, denitrifiers, sulphate reducers, fermenters and methanogens. The proteins of halophiles are magnificently engineered to function in a milieu containing 2.5M salt that encodes genes represent a valuable repository and resource for reconstruction and visualizing processes of habitat selection and adaptive evolution. Search for new enzymes endowed with novel activities and enhanced stability continues to be a desirable purpose for important commercial production of biotechnological significance. These poly-extremophiles proved excellent source of enzymes and metabolites possessing inherent ability to function in extreme conditions of high salt, alkaline pH and facilitating catalysis for industrial application in food processing, industrial bioconversion, bioremediation etc. In fact, it has just begun to realize the great potential and true

extent of diversity and suitable applications if explored them judiciously This book highlights current applications and research on halophiles to provide a timely overview Chapters are written by expert authors from around the world and include topics of varied importance which include their role to play in enzyme production restoration of soil fertility and plant growth antimicrobial and biocatalytic potential biomolecules in nanotechnology and aspects of quorum sensing The book is divided into three sections dealing with biodiversity biotechnology and sustainable exploitation of halophiles This major new work represents a valuable source of information to all those scientists interested in microorganisms in general and extremophiles in particular with respect to their innovative products and applications
