Murray,2012-09-14 Dementia is a massive and increasing global problem with the current prevalence anticipated to double every 20 years as people live longer Neuroimaging in dementia is recommended by most clinical guidelines and its role has traditionally been to exclude a mass lesion rather than to support a specific diagnosis All radiologists will be aware of a steady rise in the number of requests for brain imaging in old people but what can imaging reliably tell us and what kind of imaging should we use In affluent societies we now have a range of structural and molecular brain imaging techniques at our disposal with specific ligands and sophisticated image analysis techniques now available for clinical use However we have difficulty justifying which patients to scan using which modality and when We know that Alzheimer s disease is the most common neuropathology contributing to a diagnosis of Alzheimer s disease but we also know from large post mortem studies that most brain pathology in those who have died with a diagnosis of dementia is mixed Thus understanding different diseases that can cause dementia how these co exist or interact and appreciating that not all dementia is Alzheimer s disease is important Equally important is awareness of individual differences in response to a neuropathological burden and what factors provide resilience against dementia that might be maximized to reduce or postpone its impact This issue draws together contributions from experts in their fields to provide clarity to the topic in a comprehensive collection of articles

Alzheimer's disease is a primary neurodegenerative disease whose incidence and prevalence is rapidly approaching epidemic proportions A major reason for this is that man is living longer than he has ever lived before and the likelihood of contracting the disease is significantly greater within the elderly portion of the population The problem becomes even more acute in the light of recent estimates which predict that the number of people living beyond the age of 65 is expected to continue to increase The impact of these statistics on the family and the health care industry in terms of time effort and cost are staggering A recent report issued by the Michigan Task Force on Alzheimer's Disease and Related Conditions 1987 effectively underscores this last point Each person with a dementing disease requires an average of seven years of care either at home or in a residential care facility Care provided at home is estimated to cost about 12 000 annually for a total of 84 000 per person This is a conservative figure however because many persons with dementia spend their last few years in a nursing home at an average cost of 22 000 per year and some spend from 10 to 15 years in a nursing home for a total cost of 220 000 to 330 000 Neuroimaging biomarkers in Alzheimer's disease Samuel Barrack, 2013-10-20

In view of the growing prevalence of AD worldwide there is an urgent need for the development of better diagnostic tools and more effective therapeutic interventions Indeed much work in this field has been done during last decades As such a major goal of current clinical research in AD is to improve early detection of disease and presymptomatic detection of neuronal

dysfunction concurrently with the development of better tools to assess disease progression in this group of disorders All these putative correlates are commonly referred to as AD related biomarkers The ideal biomarker should be easy to quantify and measure reproducible not subject to wide variation in the general population and unaffected by co morbid factors For evaluation of therapies a biomarker needs to change linearly with disease progression and closely correlate with established clinico pathological parameters of the disease There is growing evidence that the use of biomarkers will increase our ability to better indentify the underlying biology of AD especially in its early stages These biomarkers will improve the detection of the patients suitable for research studies and drug trials and they will contribute to a better management of the disease in the clinical practice Indeed much work in this field has been done during last decades The vast number of important applications combined with the untamed diversity of already identified biomarkers show that there is a pressing need to structure the research made on AD biomarkers into a solid comprehensive and easy to use tool to de deployed in clinical settings To date there are few publications compiling results on this topic That is why when I was asked to address this task I accepted immediately I am happy to present you a bundle of the best articles published about biomarkers for Alzheimer s disease in recent times The Handbook of Neuropsychiatric Biomarkers, Endophenotypes and Genes Michael S.
