Qing, Yizhe Zhao, Zhiyong Zhang, 2024-03-05 This book is the first ever monograph on nematic liquid crystals for microwaves, millimeter waves, and terahertz waves. It presents the first-hand independent studies on nematic liquid crystals for microwaves, millimeter waves, and terahertz waves. This book opens with an introduction to generic liquid crystals and a retrospective review about nematic liquid crystals in microwaves, millimeter waves, and terahertz waves. Attention is then focused on the latest in-house progress on microwave, millimeter wave, and terahertz nematic liquid crystals. Synthesis and characterization of novel nematic liquid crystals are first presented, followed by indigenous technologies to manufacture functional nematic liquid crystal devices for microwaves, millimeter waves, and terahertz waves. A few self-developed representative advanced functional devices are shown to demonstrate the promising perspective of liquid crystals for not only microwaves, millimeter waves, and terahertz waves but also many other non-display applications. The presented studies will attract scientists, engineers, and students from various disciplines such as materials, chemical, electrical, biological, and biomedical engineering. The book is intended for undergraduates, graduates, researchers, professionals, and industrial practitioners who are interested in developing novel liquid crystals and further extending liquid crystals beyond display.

The book also covers optimizations, methods for passive and active devices in mm Wave 5G networks. It explores topics which influence the design and characterization of antennas such as data rates, high isolation, pattern, and spatial diversity, making 5G antennas more suitable for a multipath environment. The book represents a learning tool for researchers in the field and enables engineers, designers, and manufacturers to identify key design challenges of antennas for 5G networks and characterize novel antennas for 5G networks. **Nanoplasmonics** Carlos J.

Bueno-Alejo, 2020-04-22 During the last few years, nanomaterials have attracted the attention of the scientific community due to their extraordinary and unique properties. Their small size and the distinctive features that come with it makes these materials very attractive for use in different important fields like biomedicine, sensors, or catalysis. One of the most important properties of these materials is their interaction with light and is called surface plasmon resonance. It is a phenomenon that

happens on the surface of certain nanomaterials that confers them with unique properties This remarkable characteristic has opened a whole new field called nanoplasmonics that is acquiring more and more importance among the scientific community This book aims to review the state of the art in this new field and provide the reader with a wide overview of the new nanomaterials available and their current and future applications RFIC and MMIC Design and Technology I.D.
