Amphiphilic Block Copolymers P. Alexandridis, B. Lindman, 2000-10-18 It is the belief of the editors of this book that the recognition of block copolymers as being amphiphilic molecules and sharing common features with other well studied amphiphiles will prove beneficial to both the surfactant and the polymer communities An aim of this book is to bridge the two communities and cross fertilise the different fields To this end leading researchers in the field of amphiphilic block copolymer

self assembly some having a background in surfactant chemistry and others with polymer physics roots have agreed to join forces and contribute to this book The book consists of four entities The first part discusses theoretical considerations behind the block copolymer self assembly in solution and in the melt The second part provides case studies of self assembly in different classes of block copolymers e g polyethers polyelectrolytes and in different environments e g in water in non aqueous solvents or in the absence of solvents The third part presents experimental tools ranging from static e g small angle neutron scattering to dynamic e g rheology which can prove valuable in the characterization of block copolymer self assemblies The fourth part offers a sampling of current applications of block copolymers in e g formulations pharmaceuticals and separations applications which are based on the unique self assembly properties of block copolymers **Optical**

Metamaterials by Block Copolymer Self-Assembly Stefano Salvatore, 2014-07-11 Metamaterials are artificially designed materials engineered to acquire their properties by their specific structure rather than their composition They are considered a major scientific breakthrough and have attracted enormous attention over the past decade The major challenge in obtaining an optical metamaterial active at visible frequencies is the fabrication of complex continuous metallic structures with nano metric features This thesis presents the fabrication and characterization of optical metamaterials made by block copolymer self assembly This approach allows fabrication of an intriguing and complex continuous 3D architecture called a gyroid which is replicated into active plasmonic materials such as gold The optical properties endowed by this particular gyroid geometry include reduction of plasma frequency extraordinarily enhanced optical transmission and a predicted negative refractive index To date this is the 3D optical metamaterial with the smallest features ever made *Handbook of*

Engineering Polymeric Materials P.
