Oxidoreduction at the Plasma Membrane Relation to Growth and Transport Frederick L. Crane, D. James Morre, Hans E. Low, 1991-04-15 The concept of general oxidoreductase function at the plasma level is new Oxidoreduction at the Plasma Membrane Relation to Growth and Transport provides the first truly comprehensive coverage of the oxidoreduction reactions in plasma membranes and the role that can now be attributed to these enzymes in controlling growth and other cell functions in plants and animals The book describes the nature and orientation of oxidoreductases in plasma membranes the stimulation of cell growth by oxidants reacting with transplasma membrane electron transport changes in enzymes in tumor cells and the basis of the growth effects and oxidoreductase stimulation of membrane transport in relation to known second messenger functions such as cellular pH changes calcium transport protein phosphorylation and oxidation levels of pyridine nucleotides The book then examines the significance of these enzymes in cell culture tumor growth nerve transmission ion transport and membrane potential The book also presents a new approach to understanding the action of antitumor drugs and herbicides Biochemists biologists oncologists cancer researchers physiologists and endocrinologists will find this an indispensable reference source as they conduct studies in this exciting new area *Photomorphogenesis in Plants* R.E. Kendrick, G.H.M. Kronenberg, 2012-12-06 It is perhaps not surprising that plants have evolved a mechanism to sense the light environment about them and to modify growth for optimal use of the available life giving light Green plants and ultimately all forms of life depend on the energy of sunlight fixed during photosynthesis Unlike animals that use behaviour to find food sedentary plants use physiology to optimize their growth and development for light absorption By appreciating the quality quantity direction and duration of light plants can control such complex processes as germination growth and flowering To perceive the light environment several receptor pigments have evolved including the red far red reversible phytochrome and the blue UV absorbing photoreceptors Part 1 The quantification of light Part 2 and importance of instrumentation for photomorphogenesis research are introduced in Part 3 Isolation and characterization of phytochrome is a classic example of how photobiological techniques can predict the nature of an unknown photoreceptor Current knowledge of the phytochrome photoreceptor family is given in Part 4 and that of blue UV receptors in Part 5 Part 6 deals with the coaction of photoreceptors The light environment and its perception is addressed in Part 7 Molecular and genetic approaches and the photoregulation of gene expression compose Part 8 Part 9 contains further selected topics photomodulation of growth phototropism photobiology of stomatal movements photomovement photocontrol of flavonoid biosynthesis photobiology of fungi and photobiology of ferns The 28 chapters written by leading experts from Europe Israel Japan and the USA provide an advanced treatise on the exciting and rapidly developing field of plant photomorphogenesis *Trichoderma And Gliocladium. Plasma Membrane Oxidoreductases in Control of Animal and Plant Growth Frederick Crane,2013-04-17 The objective of this workshop was to examine the nature of plasma membrane electron transport and how this electron transport contributes to growth of cells The workshop came at a time when the study of the plasma membrane oxidoreductase activity was beginning to attract more widespread attention from researchers working with both plants and animals The rapid response of c fos and c myc Proto oncogene to stimulation of plasma membrane redox activity by external oxidants under scores a potential role of plasma membrane oxidoreductases in growth control Other experiments with isolated endosomes indicate emerging roles in endocytosis and lytic processes Primary attention was focused on trans plasma membrane electron transport which brings about the oxidation of cytosolic NADH NADPH or other substrates by electron flow across the plasma membrane to external oxidants including ferric iron semide hydroascorbate or oxygen A major theme in the workshop was the relation of this electron flow to pH changes of the cytoplasm or the transfer of protons to the external medium The presence and role of other oxidoreductases in the plasma membrane was documented especially in regard to peroxide production In plant cells this may contribute to cellular defense against invading para sites A corresponding function in animals has been long known and extensively discussed but was beyond the scope of this workshop *Blue Light Responses* ,1987 Proceedings of the National Academy of Sciences of the United States of America National Academy of Sciences (U.S.),2002

Environmental Signal Processing and Adaptation Gerhard Heldmaier,Dietrich Werner,2012-12-06 Animals and plants live in changing environmental conditions which require adaptation in order to cope with this Some of these environmental changes serve as signals which have to be sensed and interpreted correctly by the organisms to initiate the adaptation This signal processing is based on biochemical molecular and neuronal processes which are discussed in this book All examples given underline that continuous adjustment of physiological functions is an essential requirement for life and survival in complex changing environments **Blue Light-mediated Phosphorylation of a Plasma Membrane Protein in Higher Plants** Timothy Wesley Short,1991 **The Plant Plasma Membrane** Christer Larsson,Ian M. Moller,2012-12-06 The plasma membrane forms the living barrier between the cell and its surroundings For this reason it has a wide range of important functions related to the regulation of the composition of the cell interior and to communication with the cell exterior The plasma membrane has therefore attracted a lot of research interest Until the early 1970 s it was only possible to study the plasma membrane in situ its structure e g by electron microscopy and its function e g by uptake of radioactively labeled compounds into the intact cell or tissue The first isolation of plant protoplasts by enzymatic digestion of the cell wall in the early 1970 s was an important step forward in that it provided direct access to the outer surface of the plasma membrane More importantly T K Hodges and R J Leonard in 1972 published the description of a

method by which a fraction enriched in plasma membranes could be isolated from plant tissues using sucrose gradient centrifugation. As a result the 1970s saw a leap forward in our understanding of the structure and function of the plasma membrane. In 1981 S. Widell and C. Larsson published the first of a series of papers in which plasma membrane vesicles of high yield and purity were isolated from a wide range of plant tissues using aqueous polymer two phase partitioning.
