

tic radiographic and radionuclide imaging techniques in preoperative evaluation, two present current clinical staging systems and their relationship to interpretation of treatment results, and three articles are concerned with the biologic behavior of specific tumors. The remaining topics all relate to various treatment modalities. The surgical approach to these neoplasms including biopsy technique, en bloc excision, compartmental resection and amputation is discussed. A timely review of the role of pulmonary resection of metastatic lesions is also presented. The theory and results of various chemotherapy regimens are reviewed and updated. The historical and current role of radiation therapy and immunotherapy are also evaluated.

The book is well balanced, covering all of the areas relating to the diagnosis and management of sarcomas and emphasizing the need for a multidisciplinary approach. Many of the articles are primarily a review of the topic and lack depth by virtue of being primarily a presentation rather than a written effort; however, all are well referenced and provide an excellent current bibliography. The illustrations are generally good, though histologic sections suffer the usual loss in black and white printing. For the practicing oncologist or the student, this book presents a summary of current thought in the field. For the surgeon not engaged regularly in the treatment of sarcomas, this book is equally worthwhile, outlining many of the basic principles of surgical management.

**Advances in Cardiopulmonary Resuscitation.** Peter Safer (ed.). 302 pp. New York, Springer-Verlag, 1977.

IN OCTOBER OF 1975, 24 of the initiators of Modern Cardiopulmonary Resuscitation met to discuss the recent advances in and the potential future of emergency resuscitation. This Wolfereek Conference on cardiopulmonary resuscitation was based on 37 papers, and these along with the edited discussion of the papers with additions have been published in this 44 chapter, 300-page volume. Beginning with the pre-arrest period the pathophysiology of the cardiac arrest cycle is reviewed, including physiological predictors of irreversible cardiac arrest, ventricular dysrhythmias and the management of related problems. These chapters are short and provide little objective data, although the discussions are comprehensive. The second section deals with the practical management of airway obstruction and respiratory arrest, including teaching techniques of the training of paramedical personnel. Some of the material is repetitive and the variety of esophageal and other ventilatory devices reviewed in

Chapters Eight, Nine and Ten could have been compressed into a more cohesive single chapter. The third section, dealing with circulatory arrest, reviews an assortment of topics including hospital arrest statistics, the role of precordial thumping, the physiology of mechanical external compression and ventilation, the present place of open chest resuscitation, and the role of the technician in management of hypovolemia. Section four is more cohesive and more logically arranged, reviewing drugs used during cardiac arrest, vasoactive and antiarrhythmic drugs, and two experimental studies of alkalinizing therapy and intrapulmonary drug administration. Section five is devoted to electrocardiography during arrest, external cardiac stimulation, defibrillation electrophysiology and esophageal electrocardiography. Section six, dealing with the immediate post resuscitative period, contains valuable information of more recent concern dealing with the problem of postischemic anoxic brain damage from an experimental as well as from a clinical standpoint. Useful protocols for cardiopulmonary cerebral resuscitation management are provided, including plans for clinical trial of thiopental, intracranial pressure monitoring, and techniques for data handling. Section seven deals with resuscitation under special circumstances, such as massive hemorrhage, near drowning, and intra-uterine fetal resuscitation. In addition, teaching goals and legal considerations of resuscitation are reviewed. The concluding section is a series of eight interesting vignettes on the historical perspective of cardio-pulmonary resuscitation with first hand reports by some of the pioneers who were involved in the first successful clinical experiences. Although some of the sections of the book are disjointed, as might be expected from multiple contributors, and many of the chapters are rather brief and superficial, the book is unique in its review of current problems and successful approaches to cardiopulmonary resuscitation. The discussions also provide a critical assessment of those areas which remain inadequately understood and which will probably stimulate future meetings. The style is easy to read and the book should be a valuable reference for both medical and paramedical personnel interested in this important problem.

*Imaging of Bone Tumors and Tumor-Like Lesions* A. Mark Davies, Murali Sundaram, Steven J. James, 2009-08-21 Detection and characterization of bone tumors with imaging remains a big challenge for every radiologist notwithstanding the impressive progress achieved by the introduction of several new imaging modalities. Moreover, new concepts in surgical and oncological treatment of these lesions require from the radiologist appropriate and focused answers to the specific questions asked by the referring physicians in order to choose the best therapeutic approach for the individual patient. This comprehensive textbook describes in detail the possibilities and limits of all modalities including MRI, CT, nuclear medicine and interventional radiological procedures employed for the modern imaging of tumoral and tumor-like lesions of bone. Their role in the diagnosis, surgical staging, biopsy and assessment of response to therapy is discussed in detail covering all tumor subtypes as well as their specific anatomical location. Well selected and technically impeccable illustrations strongly enhance the didactic value of this work. I am very much indebted and grateful to the three editors: A. Mark Davies, Murali Sundaram and Steven L. J. James, world authorities in musculoskeletal radiology, for their superb scientific achievement in preparing and editing this wonderful volume, as well as for their individual chapters. I would also like to thank the large international group of collaborating authors who are also widely acknowledged for their specific expertise in the area of bone tumors for their outstanding contributions.

*Diagnostic Nuclear Medicine* Martin P. Sandler, 2003 The gold standard text reference *Diagnostic Nuclear Medicine* is now in its Fourth Edition with a sharp clinical focus, a streamlined new single volume format and a very attractive price. Written by the top authorities in the specialty, this brand new edition offers encyclopedic coverage of clinically relevant developments in nuclear medicine, including instrumentation, radiopharmaceuticals and applications. Readers will find the latest on PET, molecular imaging, SPECT, myocardial perfusion imaging, monoclonal antibody therapy and the use of functional imaging studies in oncology. This edition has been trimmed from two volumes to one so that readers can find exactly what they need quickly without cross-checking between volumes.

*Current Concepts of Diagnosis and Treatment of Bone and Soft Tissue Tumors* E. Stahl, H. K. Uthoff, 2012-12-06 During the past decade the prognosis of bone and soft tissue tumors has improved considerably. This progress has not only been due to improved therapeutics and diagnostic methods but also due to a team approach now universally adopted. Comparison of results possible today were hampered in the past by lack of a clinically relevant staging system and definitive treatment protocols. The complexity of the therapeutic management of bone tumors requires a constant exposure to tumors, highly skilled diagnostic techniques and specialized expertise. It is therefore not surprising to learn that small and medium-sized hospitals embarking on the diagnosis and treatment of bone and soft tissue tumors are generally less successful than better equipped major centers. This fact has already been recognized by most physicians and surgeons who now refer their patients to specialized oncologic centers. Nevertheless, they all have to

know the present state of the art This symposium was therefore mostly addressed to them This international symposium organized by the Division of Orthopaedic Surgery University of Ottawa and cosponsored by the Association des Chirugiens Orthopedistes du Quebec was held in Ottawa from May 12 14 1983 Each of the 40 presentations clearly demonstrates that disregard for proper staging before initiation of treatment and omission of a clearly defined treatment protocol is definitely unacceptable in view of the knowledge we have acquired

**Pathology of the Larynx** L. Michaels, 2012-12-06 The purpose of this work is to review the current knowledge of laryngeal pathology in the light of my experience at the Institute of Laryngology and Otology London The role of histopathological investigations in the care of patients with diseases of the larynx is given special consideration Radiological study of the larynx has become more refined in recent years with the introduction of computerised tomography Microlaryngoscopy with biopsy of the interior of the larynx is now a frequent

procedure in the diagnosis of laryngeal disease In the effort to interpret the findings resulting from these methods the need for a monograph outlining the pathological basis of laryngeal disorders has arisen To the best of my knowledge such a work devoted to the pathology of the larynx only has never been written a modern study in this field is certainly not available I have aimed the text towards the practising pathologist in order to give it the broadest scope It was necessary therefore to include an account of the basic anatomy of the larynx For this purpose and in subsequent descriptions throughout the book I have not used the formal anatomical terminology for the two folds on either side of the ventricle of the larynx There is some variation in the use of these terms and they are not yet completely in general use

**Biological Characterization of Bone Tumors** Albert Roessner, 2012-12-06

During the past few years a considerable number of monographs on bone tumors have been published They are mainly restricted to bone tumors as clinical pathological entities since their diagnosis more than that of other tumors requires the interdisciplinary cooperation between orthopedic specialist radiologist and pathologist However investigations concerning the histogenesis of bone tumors are rather limited although they might be helpful in explaining the unique morphological heterogeneity of tumors of the skeletal system Furthermore the histogenetic approach in the study of bone tumors may facilitate the interpretation of the advanced cytobiological methods available for improving classification and diagnosis Therefore this volume presents recent pathological advances in the biological characterization of bone tumors A major chapter deals with the differential diagnosis of Ewing's sarcoma as regards its demarcation from the so called neuroectodermal tumor of bone The analysis of the ground substances in bone forming tumors may be helpful for their classification Therefore the volume includes a chapter on the biochemical and histochemical analysis of different osteosarcoma types Recently it has become clear that in addition to different collagen types which are not specific for bone tissue several bone specific proteins occur one of which is osteonectin Its distribution is obviously important for the classification and diagnosis of osteoblastic tumors Proliferative behavior is of major importance for the diagnosis of malignant tumors
