Developments in Bovine Immunology - An Integrated View Kieran G. Meade,2015-07-22 The world s population is predicted to hit 9 Billion by 2050 and with it food demand is predicted to increase substantially The World Bank estimates that cereal and meat production needs to increase by 50% and 85% respectively between 2000 and 2030 to meet demand putting serious pressure on the global agricultural industry Critical to

meeting this demand for food are mechanisms to reduce the incidence of animal disease. With in excess of 1.3 billion cattle globally, the total cost of infectious diseases is difficult to estimate. However, in North America alone, the cost is predicted to be 18 billion annually. Non-infectious diseases also account for another major impediment to the production capacity and welfare of animals, as well as the economic sustainability of farming. However, animal diseases have implications that spread far beyond the farm gate. Infectious agents can also contaminate the food chain and potentially affect human health. Controlling diseases through better preventative and treatment methods requires a detailed understanding of the immune response in livestock species. Multiple studies have identified associations between variation in immune genes and disease susceptibility, which potentially opens up new avenues to select animals with superior disease resistance. Detailed understanding of immunity in cattle is leading to the design of more effective vaccines. Furthermore, appreciation of the significant differences between rodent and human immune responses has also led to bovine models being developed for some human diseases. The publication of the bovine genome and the advent of next-generation sequencing technologies have facilitated a massive expansion in our knowledge of the immune response in cattle. As a result, there has been an explosion of exciting research findings, including in metagenomics and epigenetics. Recently, there has been a welcome move to integrate our emerging understanding of the immune response with detailed studies of other important physiological processes, including nutrition and reproduction. The interactions between the reproductive system, nutrition, and the immune system are of particular interest, since each places significant demands on the animal at various stages through the production cycle. The interplay between these morphologically diffuse systems involves widely distributed chemical signals in response to environmental input, and each system must interact for the normal functioning of the other. A comprehensive systems approach is improving our understanding of normal physiological interactions between these systems, and furthermore, how dysregulation can lead to disease. The successful translation of bovine immunological research into improved treatments for animal disease requires tight interaction between diverse scientific and clinical disciplines, including immunology, microbiology, endocrinology, physiology, nutrition, reproduction, and clinical veterinary medicine. With so much recent progress in the field, we believe that it is valuable and well-timed to review the broad variety of the relevant studies that attempt to increase our understanding through comprehensive collaboration between these disciplines. We are looking forward to a wide and vivid discussion of developments in bovine immunology and related issues, and we expect that our readers will profoundly benefit from new exciting insights and fruitful collaborations.

The Aesthetic Thought and View of Art of Thomas Aquinas
Zhiqing Zhang, 2024-08-30

This book examines Aquinas's aesthetic thought and view of art within the broader context of medieval aesthetics and the history of aesthetic development, emphasizing its profound influence on later aesthetics. The book not only elaborates on Aquinas's efforts to establish coherence between faith and reason, the transcendent and empirical, as well as its significance, but also discusses the main contents and characteristics of Aquinas's aesthetic thought from the three

aspects of the ontology of beauty the theory of form and the theory of experience By examining Aquinas s aesthetic thought and view of art in relation to modern aesthetics and twentieth century aesthetics this book reveals the immense vitality of Aquinas s aesthetic thought *Context in Communication: A Cognitive View* Gabriella Airenti,Marco Cruciani,Alessio Plebe,2017-04-03 Context is what contributes to interpret a communicative act beyond the spoken words It provides information essential to clarify the intentions of a speaker and thus to identify the actual meaning of an utterance A large amount of research in Pragmatics has shown how wide ranging and multifaceted this concept can be Context spans from the preceding words in a conversation to the general knowledge that the interlocutors supposedly share from the perceived environment to features and traits that the participants in a dialogue attribute to each other This last category is also very broad since it includes mental and emotional states together with culturally constructed knowledge such as the reciprocal identification of social roles and positions The assumption of a cognitive point of view brings to the foreground a number of new questions regarding how information about the context is organized in the mind and how this kind of knowledge is used in specific communicative situations A related very important question concerns the role played in this process by theory of mind abilities ToM both in typical and atypical populations In this Research Topic we bring together articles that address different aspects of context analysis from theoretical and empirical perspectives integrating knowledge and methods derived from Philosophy of language Linguistics Cognitive Science Cognitive Neuroscience Developmental and Clinical Psychology
