Biomechanics The first volume deals with the mechanical properties of living tissues The present volume deals with the mechanics of circulation A third volume will deal with respiration fluid balance locomotion growth and strength This volume is called Bio dynamics in order to distinguish it from the first volume The same style is followed My objective is to present the mechanical aspects of physiology in precise terms of mechanics so that the subject can become as lucid as physics The motivation of writing this series of books is as I have said in the preface to the first volume to bring biomechanics to students of bioengineering physiology medicine and mechanics I have long felt a need for a set of books that will inform the students of the physiological and medical applications of biomechanics and at the same time develop their training in mechanics In writing these books I have assumed that the reader already has some basic training in mechanics to a level about equivalent to the first seven chapters of my First Course in Continuum Mechanics Prentice Hall 1977 The subject is then presented from the point of view of life science while mechanics is developed through a sequence of problems and examples The main text reads like physiology while the exercises are planned like a mechanics textbook The instructor may fill a dual role teaching an essential branch of life science and gradually developing the student's knowledge in mechanics
