Geophysical Abstracts ... ,1953 Public Debts Barry J. Eichengreen,2011 The importance of fiscal discipline for developed countries has long been ignored or minimized because they seem able to borrow and to keep borrowing for decades The crisis has shown that discipline may be slow to assert itself but has acutely painful consequences when it does This 13th Geneva Report on the World Economy is devoted to fiscal policy reforms in the US Europe and Japan It offers a common political economy framework to diagnose the need for fiscal consolidation and proposes institutional solutions rooted in that diagnosis It includes a detailed analysis of how we got to the current situation as well as a look at the very long run when demographic factors already in place will sharpen an already degraded situation The political economy framework presents the common pool interpretation of the deficit bias the widespread tendency of demographic governments to spend more than they can collect in taxes It arises because those who benefit from public spending are not the same as those who pay taxes The former ask for more spending the latter ask for less taxation and governments need to please voters to be re elected The policy response must address these fundamental characteristics of advanced democracies by adopting institutions and rules that lessen the common pool problem Because electoral systems differ widely from one country to another leading to different forms of common pool effects no single institutional arrangement is best suited everywhere This report links political systems to forms of institutional arrangements At this juncture when the sovereign debt crisis is acute in the Euro zone menacing in the US and potentially festering in Japan the report argues that fiscal stabilization is easier the faster the economy is growing It also advances suggestions on how to make debts sustainable through growth enhancing measures Page 4 of cover

Spatial Database Transfer Standards 2: Characteristics for Assessing Standards and Full Descriptions of the National and International Standards in the World H. Moellering,R. Hogan,1997-07-03 This book represents five and a half years of work by the ICA Commission on Standards for the Transfer of Spatial Data during the 1991 95 ICA cycle The effort began with the Commission working to develop a set of scientific characteristics by which every kind of spatial data transfer standard could be understood and assessed This implies that every facet of the transfer process must be understood so that the scientific characteristics could be most efficiently specified The members of the Commission spent hours looking at their own standard and many others to ascertain how to specify most effectively the characteristic or subcharacteristic in question The result is a set of internationally agreed scientific characteristics with 13 broad primary level classes of characteristics 85 secondary characteristics and about 220 tertiary characteristics that recognizes almost every possible capability that a spatial data transfer standard might have It is recognized that no one standard possesses all of these characteristics but contains a subset of these characteristics However these characteristics have been specified in such a way to facilitate understanding of individual standards and use by interested parties of making comparisons for their own purposes Although individual applications of a standard may be for different purposes this set of characteristics provides a uniform measure by which the various standards may be assessed The book presents an Introduction and four general

chapters that describe the spatial data transfer standards activities happening in Europe North America Asia Pacific and the ISO community This provides the context so the reader can more easily understand the scientific and technical framework from which a particular standard has come The third section is a complete listing of all of the three levels of characteristics and their meaning by the inclusion of a set of definitions for terms used in the book The fourth section and by far the largest contains 22 chapters that assess each of the major national and international spatial data transfer standards in the world in terms of all three levels of characteristics Each assessment has been done by a Commission member who has been an active participant in the development of the standard being assessed in the native language of that standard A cross table chart is also provided
