Region Hans M. Bolli, J. P. Beckmann, J. B. Saunders, 1994-06-16 Benthic foraminifera from the classic southern Caribbean region are presented in this book to provide valuable information on ranges for biostratigraphers working in the region and beyond Around 1000 of the more important species are assembled from the Barremian early Cretaceous to the middle Miocene approximately 120 to 10 million years before the present The deeper water benthic species are tied in to the zonal scheme used in Plankton Stratigraphy published by Cambridge University Press in 1985 The taxa have been brought up to date generically and in many cases new comparisons between species have been made the late Cretaceous and early Paleogene are particularly detailed This information together with detailed illustrations will enable the taxa to be used stratigraphically **Sedimentary Cover of the Craton in Canada** D.F. Stott, J.D. Aitken, 1993 The early chapters of the volume present data and interpretations of the geophysics of the craton and summarise with sequential maps the tectonic evolution of the craton The main body of the text and accompanying plates and figures present the stratigraphy structural history and economic geology of specific sedimentary basins and regions The volume concludes with a summary chapter in which the currently popular theories of cratonal tectonics are discussed and the unresolved questions are identified
