Arterial Mesenchyme And Arteriosclerosis:

Arterial Mesenchyme and Arteriosclerosis William Wagner, 2013-03-09 Presently and in the past the predominant investigative emphasis among research workers in arteriosclerosis has been on plasma and arterial lipids Recent data from a number of laboratories suggest that arterial mesenchyme is of considerable importance in the pathogenesis and fate of arteriosclerotic lesions The significance of some of these observations made it clear that there was need for intensified research on the connective tissue components of the arteriosclerotic lesion and that arteriosclerosis research workers could benefit from a more comprehensive view of the subject Because of their experience in the field of arteriosclerosis and their interest in stimulating new directions for research on the lesion the Committee on Coronary Artery Lesions and Myocardial Infarctions of the Council on Arteriosclerosis American Heart Association planned an International Workshop on Arterial Mesenchyme and Arteriosclerosis The Workshop brought together scientists expert in connective tissue research and research on arteriosclerosis who presented the current status of knowledge in their areas of expertise The Workshop was held April 2 3 1973 at the Royal Orleans Hotel New Orleans Louisiana and was attended by more than 170 people The twenty papers and discussions presented in this volume summarize the proceedings of the Workshop and represent a comprehensive review of the role of arterial mesenchyme in arteriosclerosis

Arteriosclerosis H. Just, W. Hort, A.M. Zeiher, 2012-12-06 A vast literature has been concerned with arteriosclerosis and yet many aspects of pathogenesis and of the mechanism of development of the arteriosclerotic vascular lesion remain only poorly understood In recent years our knowledge of the earliest stages of arteriosclerosis have greatly improved By now we have learned to relate morphologic changes to disturbances in function It has been of particular importance that components of the arterial wall could be analyzed in regard to dysfunction for example in the endothelium or the vascular smooth muscle The interaction of the different morphological components of the vascular wall could thus be much better understood Likewise the interaction between the arterial wall and the flowing blood could be much better described including the intimate relationship between platelets and the endothelium the coagulation system and the endothelium the granulocytes and the endothelial cell layer as well as processes of migration of blood cells into the subendothelial space The recognition of functional and morphological disturbance has attained clinical significance not only because the arteriosclerotic diseases have quantitatively reached the dimensions of an epidemic that is of a magnitude never been witnessed It is also because of the development of new drugs that interfere with the atherogenic process and thereby prevent the development of the disease or halt its progression It is also becoming increasingly possible to inhibit the occurrence of complications in existing arteriosclerotic lesions in manifest disease i e

New Aspects of Metabolism and Behaviour of Mesenchymal Cells during the Pathogenesis of Arteriosclerosis Werner H. Hauss, 2013-03-14

The Artery and the Process of Arteriosclerosis Stewart Wolf, 2013-03-09 The present volume contains the first half of the edited transcript of a six day Conference Fundamental Data on Reactions of Vascular Tissue in

Man held April 19 25 1970 in Lindau West Germany The remainder of the proceedings dealing with the epidemiologic clinical and preventive aspects of arteriosclerosis will be published in a second volume The Conference was held under the auspices of the International Society of Cardiology the International Cardiology Foundation and the European Atherosclerosis Group The aim of the Conference was to achieve a synthesis of present knowledge concerning arteriosclerosis Therefore workers were brought together from several countries and from various disciplines that do not ordinarily intercommunicate for free exchange of data and ideas Six broad subject areas were introduced by single papers three of them are included in this volume In the discussion which followed each formal presentation the participants attempted to reconcile disparate data and interpretations and to reach a clear identification of important areas of ignorance and of crucial questions for future research The format of the proceedings does not follow precisely that of the Conference itself The formal papers are included somewhat abbreviated and excerpts of the discussion have been gathered under a series of topics arranged in logical sequence Therefore the quoted statements do not necessarily appear in order or in the place in the program where they were made Principal issues syntheses and unanswered questions are interspersed among the topics as editorial comments

Pathobiology of the Human Atherosclerotic Plaque Seymour Glagov, William P., III Newman, Sheldon A. Schaffer, 2012-12-06 Seymour Glagov The last meeting devoted exclusively to an examination of the atherosclerotic plaque took place in Chicago 25 years ago under the joint auspices of the Council on Arteriosclerosis of the American Heart Association and the Chicago Heart Association The proceedings were published subsequently in a volume entitled Evolution of the Atherosclerotic Plaque edited by Richard J Jones 1 Both experimental and human lesions were considered and several provocative new approaches to the disorder were discussed The electron microscope was being applied systematically to the study of blood vessels at that time so that details of the infrastructure and cellular composition of the artery wall and of atherosclerotic lesions were presented in some detail There was as one result of these explorations considerable discussion of morphologic evidence suggesting that the principal cell involved in the atherogenic process was neither the fibroblast nor the macrophage as had been supposed but the smooth muscle cell In particular the findings indicated that this cell could incorporate lipid and become a foam cell

Drugs, Lipid Metabolism, and Atherosclerosis David Kritchevsky, 2012-12-06 This volume comprises the proceedings of the sixth International Symposium on Drugs Affecting Lipid Metabolism Since the first of these symposia in 1960 these triennial meetings have been devoted to the exploration of new ideas new data and new concepts related to lipid metabolism and atherosclerosis The sixth Meeting was particularly stimulating in this regard The concept of the protective action of HDL was thoroughly explored within the framework of its molecular biology with data on its epidemiological as well as its in vitro mechanisms of action being discussed The action of drugs on arterial and HDL metabolism was also discussed as were newer aspects of platelet aggregation especially as related to prostaglandins New ground was also broken in discussions of lipid mobilization and

Rene Malinow, 2013-06-29 The Advanced Study Institute on Regression of Atherosclerotic Lesions sponsored by the North Atlantic Treaty Organization was held in Maratea Italy September 11-13 1983 The institute was designed to foster discussion of experimental data on the regression of atherosclerosis in animals and evidence of a similar phenomenon in humans The participating scientists showed with anatomical and biochemical data that atherosclerosis regresses in cholesterol fed animals after withdrawal of atherogenic stimuli The existence of regression in humans was inferred from sequential angiographic visualization of arteries but anatomical and biochemical characteristics of the process have not been defined Two mechanisms are probably involved in such an angiographic regression The first which may occur when hyperlipidemia is partly or fully corrected or during undernutrition or other metabolic abnormalities may be related to atherosclerosis changes noted in animals undergoing regression The second type seems independent of changes in plasma lipid levels and may involve resolution of thrombi or other underlying arterial wall factors The relative frequencies of the two mechanisms are unknown whether they can occur simultaneously also warrants consideration It is likely that an exciting milestone will be forthcoming when regression of atherosclerosis is unequivocally demonstrated in humans Publication of these institute proceedings constitutes a valuable background for future developments **Factors in Formation and Regression of the Atherosclerotic Plaque** Gustav R.V. Born, Alberico L. Catapano, Rodolfo Paoletti, 2012-12-06 Interest in the field of atherosclerosis research has broadened in recent years However the main focus remains on the physiopathology of the arterial wall and on its interaction with blood constituents The purpose of this NATO Advanced Study Institute on Factors in Formation and Regression of the Atherosclerotic Plaque was to discuss the following points a The physiopathology of the arterial wall b Animal models c Methods of studying the progression and regression of atherosclerotic lesions quantitatively d The role of lipoproteins platelets smoke alcohol etc in the formation of atherosclerotic lesions e The pharmacological and dietary control of risk factors This volume is a collection of the most relevant presentations on these topics We hope it will provide a background for young scientists as well as a stimulus for further research to biologists and clinicians We wish to acknowledge the support of NATO and the Nutrition Foundation of Italy in organizing this Advanced Study Institute

The purpose of this book is to collect and summarize in one place most of the published information on LDL through 1975 To this end more than 1500 references are cited in the papers that make up this volume The A B C apolipoprotein classification system was adopted for use throughout this work In addition to the A B C and D families of apolipoproteins apoE is used to designate the arginine rich apolipo protein This classification system is used because it is far less cumbersome than other proposed classification schemes for apolipoproteins **Diabetes Literature Index** ,1975 *Research Awards Index* ,

Atherosclerosis IV G. Schettler,Y. Goto,Y. Hata,G. Klose,2012-12-06 The presence of monotypism in thick atherosclerotic lesions of black females with G 6 PD mosaicism first reported by the Benditts 1973 has been confirmed in two other laboratories However we believe that it is premature to conclude that the finding of monotypism necessarily indicates monoclonal origin of atherosclerotic lesions We have suggested two alternative explanations for the observation of monotypism which we believe must be shown to be invalid before accepting monoclonal origin as the only plausible way to account for the observed G 6 PD monotypism One of these two alternatives relates to clonal heterogeneity of cell growth potential i e during the course of progressive growth of a lesion progeny of one cell may overgrow all others in a portion of the lesion The other alternative is that one of the G 6 PD alleles may be linked to genes that afford a preferential survival characteristic in the abnormal environment present in atherosclerotic lesions Thus cells with one allele may be able to grow better than cells with the other allele and this characteristic may be unrelated to A ness or B ness We have studied initiation of lesions in He diet fed swine and demonstrated that all active lesions that were studied were of multiple cell origin not monoclonal We have studied cell growth patterns in developing atherosclerotic lesions in He diet fed swine and found evidence consistent with clonal heterogeneity in growth potential of lesion cells Comparative Pathology of the Heart F.
