Crack Theory And Edge Singularities:

Crack Theory and Edge Singularities D. V. Kapanadze, Bert-Wolfgang Schulze, 2013-03-14 Boundary value problems for partial differential equations play a crucial role in many areas of physics and the applied sciences. Interesting phenomena are often connected with geometric singularities; for instance, in mechanics, elliptic operators in corresponding models are then singular or degenerate in a typical way. The necessary structures for constructing solutions belong to a particularly beautiful and ambitious part of the analysis. Cracks in a medium are described by hypersurfaces with a boundary. Configurations of that kind belong to the category of spaces/manifolds with geometric singularities here with edges. In recent years, the analysis on such in general stratified spaces has become a mathematical structure theory with many deep relations with geometry, topology, and mathematical physics. Key words in this connection are operator algebras, index theory, quantisation, and asymptotic analysis. Motivated by Lamé's system with two-sided boundary conditions on a crack, we ask the structure of solutions in weighted edge Sobolev spaces and subspaces with discrete and continuous asymptotics. Answers are given for elliptic systems in general. We construct parametrices of corresponding edge boundary value problems and obtain elliptic regularity in the respective scales of weighted spaces. The original elliptic operators as well as their parametrices belong to a block matrix algebra of pseudo-differential edge problems with boundary and edge conditions satisfying analogues of the Shapiro-Lopatinskij condition from standard boundary value problems. Operators are controlled by a hierarchy of principal symbols with interior boundary and edge components. **Crack Theory and Edge Singularities** David Kapanadze, 2001

Pseudo-differential Operators Luigi Rodino, Bert-Wolfgang Schulze, Man Wah Wong, 2007-11-21 This volume is based on lectures given at the workshop on pseudo-differential operators held at the Fields Institute from December 11, 2006 to December 15, 2006. The two main themes of the workshop and hence this volume are partial differential equations and time-frequency analysis. The contents of this volume consist of five mini-courses for graduate students and post-docs and fifteen papers on related topics. Of particular interest in this volume are the mathematical underpinnings, applications, and ramifications of the relatively new Stockwell transform, which is a hybrid of the Gabor transform and the wavelet transform. The twenty papers in this volume reflect modern trends in the development of pseudo-differential operators. *Elliptic Mixed, Transmission and Singular Crack Problems* Gohar Harutyunyan, Bert-Wolfgang Schulze, 2007 Mixed transmission or crack problems belong to the analysis of boundary value problems on manifolds with singularities. The Zarembo problem with a jump between Dirichlet and Neumann conditions along an interface on the boundary is a classical example. The central theme of this book is to study mixed problems in standard Sobolev spaces as well as in weighted edge spaces where the interfaces are interpreted as edges. Parametrices and regularity of solutions are obtained within a systematic calculus of boundary value problems on manifolds with conical or edge singularities. This calculus allows singularities on the interface and homotopies between mixed and crack problems. Additional edge conditions are computed in terms of relative index.

results In a detailed final chapter the intuitive ideas of the approach are illustrated and there is a discussion of future challenges A special feature of the text is the inclusion of many worked out examples which help the reader to appreciate the scope of the theory and to treat new cases of practical interest This book is addressed to mathematicians and physicists interested in models with singularities associated boundary value problems and their solvability strategies based on pseudo differential operators The material is also useful for students in higher semesters and young researchers as well as for experienced specialists working in analysis on manifolds with geometric singularities the applications of index theory and spectral theory operator algebras with symbolic structures quantisation and asymptotic analysis

Boundary Value Problems with Global Projection Conditions Xiaochun Liu, Bert-Wolfgang Schulze, 2018-10-30 This book presents boundary value problems for arbitrary elliptic pseudo differential operators on a smooth compact manifold with boundary In this regard every operator admits global projection boundary conditions giving rise to analogues of Toeplitz operators in subspaces of Sobolev spaces on the boundary associated with pseudo differential projections The book describes how these operator classes form algebras and establishes the concept for Boutet de Monvel's calculus as well as for operators on manifolds with edges including the case of operators without the transmission property Further it shows how the calculus contains parametrices of elliptic elements Lastly the book describes natural connections to ellipticity of Atiyah Patodi Singer type for Dirac and other geometric operators in particular spectral boundary conditions with Calderón Seeley projections and the characterization of Cauchy data spaces
