Understanding Brain Aging Hans J. Grabe, Reinhold Schmidt, Stephanie DeBette, Mohamad Habes, 2022-01-24

Bookbuyers' Reference Book, 1973 The Evolution of Rhythm Cognition: Timing in Music and Speech Andrea

Ravignani, Henkjan Honing, Sonja A. Kotz, 2018-07-24 Human speech and music share a number of similarities and differences. One of the closest similarities is their temporal nature as both i develop over time ii form sequences of temporal intervals possibly differing in duration and acoustical marking by different spectral properties which are perceived as a rhythm and iii generate metrical expectations. Human brains are particularly efficient in perceiving, producing and processing fine rhythmic information in music and speech. However, a number of critical questions remain to be answered: Where does this human sensitivity for rhythm arise? How did rhythm cognition develop in human evolution? How did environmental rhythms affect the evolution of brain rhythms? Which rhythm-specific neural circuits are shared between speech and music or even with other domains? Evolutionary processes on long time scales often prevent direct observation; understanding the psychology of rhythm and its evolution requires a close-fitting integration of different perspectives. First, empirical observations of music and speech in the field are contrasted and generate testable hypotheses. Experiments exploring linguistic and musical rhythm are performed across sensory modalities, ages, and animal species to address questions about domain specificity, development, and an evolutionary path of rhythm. Finally, experimental insights are integrated via synthetic modeling, generating testable predictions about brain oscillations underlying rhythm cognition and its evolution. Our understanding of the cognitive, neurobiological, and evolutionary bases of rhythm is rapidly increasing. However, researchers in different fields often work on parallel, potentially converging strands with little mutual awareness. This research topic builds a bridge across several disciplines, focusing on the cognitive neuroscience of rhythm as an evolutionary process. It includes contributions encompassing, although not limited to: 1. developmental and comparative studies of rhythm, e.g. critical acquisition periods, innateness; 2. evidence of rhythmic behavior in other species, both spontaneous and in controlled experiments; 3. comparisons of rhythm processing in music and speech, e.g. behavioral experiments, systems neuroscience perspectives on music speech networks; 4. evidence on rhythm processing across modalities and domains; 5. studies on rhythm in interaction and context, social affective, etc.; 6. mathematical and computational, e.g. connectionist, symbolic models of rhythmicity as an evolved behavior. *Cumulated Index Medicus*, 1976 **Applied Topics in Health Psychology** Marie Louise Caltabiano, Lina Ricciardelli, 2012-08-14 This selection of in-depth critical and comprehensive chapters on topical issues in applied health psychology features the work of key researchers and practitioners in the Australasian health system and deals with both theoretical and methodological aspects of the subject. The first health psychology text aimed specifically at regional postgraduate trainees. Covers an array of topics and issues and focuses on applied aspects of clinical health and health promotion. Includes both specialized topics and new frontiers of research. Contextualizes health psychology teaching and learning for Australasian students.
