Coding Systems Applied to Study Interactions Between Couples where One Spouse Has a Chronic Condition

Stephanie Linda Ellis-Gray, 2013 This thesis comprises a systematic literature review and empirical paper investigating observational coding systems that have been applied to study interactions between couples where one spouse has a diagnosis of a chronic condition The literature review offers a critical evaluation of nine coding systems that have been used by 14 papers A description of each coding system is provided as well as its theoretical development evaluation of its application reliability validity generalizability and utility with a chronic condition population The review concludes that tailored coding systems need to be developed that focus on specific behaviours that would inform care of someone with a chronic condition The empirical paper presents the development and psychometric evaluation of an observational coding system for person centred spousal care Eleven couples where one spouse had a diagnosis of dementia were video taped completing an everyday task These videos were coded by three trained raters Care giving spouses also completed the Birmingham Relationship Continuity Measure as a measure of relationship continuity Results suggested that the coding system had good inter rater

reliability although validity needs to be evaluated The hypothesis that spouses scoring high on relationship continuity would relate using a more person centred approach was not supported
