Animal Species Their Evolution:

Animal Species and Their Evolution Arthur James Cain, 1968 *Animal Species and Their Evolution* A. J. Cain, 2014-07-14 Long before Charles Darwin undertook his first voyage animal taxonomists had begun the scientific classification of animals plants and minerals In the mid 1950s taxonomist A J Cain summarized the state of knowledge about the structure of the living world in his major book *Animal Species and Their Evolution* His work remains remarkably current today Here Cain explains each of the terms by which scientists now classify all animals from species through genus family order class and phylum The work of the modern taxonomist is dependent on the work of paleontologists field biologists ecologists and other specialists who help piece together the puzzle of nature This seminal text will interest students in each of these areas It will also appeal to historians of science and to all amateur scientists with an interest in the animal kingdom Originally published in 1993 The Princeton Legacy Library uses the latest print on demand technology to again make available previously out of print books from the distinguished backlist of Princeton University Press These editions preserve the original texts of these important books while presenting them in durable paperback and hardcover editions The goal of the Princeton Legacy Library is to vastly increase access to the rich scholarly heritage found in the thousands of books published by Princeton University Press since its founding in 1905 *Animal Species and Their Evolution* A. J. Cain, 2013

Neurobiology of human language and its evolution: Primate and Nonprimate Perspectives Constance Scharff, Angela D. Friederici, Michael Petrides, The evolution of human language has been discussed for centuries from different perspectives Linguistic theory has proposed grammar as a core part of human language that has to be considered in this context Recent advances in neurosciences have allowed us to take a new neurobiological look on the similarities and dissimilarities of cognitive capacities and their neural basis across both closely and distantly related species A couple of decades ago the comparisons were mainly drawn between human and non human primates investigating the cytoarchitecture of particular brain areas and their structural connectivity Moreover comparative studies were conducted with respect to their ability to process grammars of different complexity So far the available data suggest that non human primates are able to learn simple probabilistic grammars but not hierarchically structured complex grammars The human brain which easily learns both grammars differs from the non human brain among others in how two language relevant brain regions Broca's area and superior temporal cortex are connected structurally Whether the more dominant dorsal pathway in humans compared to non human primates is causally related to this behavioral difference is an issue of current debate Ontogenetic findings suggest at least a correlation between the maturation of the dorsal pathway and the behavior to process syntactically complex structures although a causal prove is still not available Thus the neural basis of complex grammar processing in humans remains to be defined More recently it has been reported that songbirds are also able to distinguish between sound sequences reflecting complex grammar Interestingly songbirds learn to sing by imitating adult song in a process not unlike

language development in children Moreover the neural circuits supporting this behavior in songbirds bear anatomical and functional similarities to those in humans In adult humans the fiber tract connecting the auditory cortex and motor cortex dorsally is known to be involved in the repetition of spoken language This pathway is present already at birth and is taken to play a major role during language acquisition In songbirds detailed information exist concerning the interaction of auditory motor and cortical basal ganglia processing during song learning and present a rich substrate for comparative studies The scope of the Research Topic is to bring together contributions of researchers from different fields who investigate grammar processing in humans non human primates and songbirds with the aim to find answers to the question of what constitutes the neurobiological basis of grammar learning Open questions are Which brain networks are relevant for grammar learning Is there more than one dorsal pathway one from temporal cortex to motor cortex and one to Broca's area and if so what are their functions Has the ability to process sequences of a given hierarchical complexity evolved in different phylogenetic lines birds primates other vocal production learners such as bats Is the presence of a sensory to motor circuit in humans a precondition for development of a dorsal pathway between the temporal cortex and Broca's area What role do subcortical structures Basal Ganglia play in vocal and grammar learning

Animals in the Sociologies of Westermarck and Durkheim Salla Tuomivaara, 2019-09-04 This book explores why animals at some point disappeared from the realm and scope of sociology The role of sociology in the construction of a science of the human has been substantial building representations of the human sphere of life as unique Within the sociological tradition however animals have often been invisible even non-existent Through in depth comparisons of the texts of prominent early sociologists Emile Durkheim and Edward Westermarck Tuomivaara shows that despite this exclusion representations of animals and human animal relations were far more varied in early works than in the later sociological canon Addressing a significant gap in the interdisciplinary field of animal studies Tuomivaara presents a close reading of the historical treatment of animals in the works of Durkheim and Westermarck to determine how the human animal boundary was established in sociological theory The diverse forms in which animals and the animal appear in the works of early classical sociology are charted and explored alongside the sociological themes that bring animals into these texts Situated in contemporary theory from critical animal studies to posthumanism this important book lays the groundwork for a disciplinary shift away from this sharp human animal dualism

The Evolution of Primary Sexual Characters in Animals Janet Leonard, Alex Cordoba-Aguilar, 2010-07-16 Primary sexual traits those structures and processes directly involved in reproduction are some of the most diverse specialized and bizarre in the animal kingdom Moreover reproductive traits are often species specific suggesting that they evolved very rapidly This diversity long the province of taxonomists has recently attracted broader interest from evolutionary biologists especially those interested in sexual selection and the evolution of reproductive strategies Primary sexual characters were long assumed to be the product of natural selection exclusively A recent alternative suggests that sexual selection explains much of the diversity of primary

sexual characters A third approach to the evolution of reproductive interactions after copulation or insemination has been to consider the process one of sexual conflict That is the reproductive processes of a species may reflect as does the mating system evolution acting on males and on females but in different directions In this volume authors explore a wide variety of primary sexual characters and selective pressures that have shaped them from natural selection for offspring survival to species isolating mechanisms sperm competition cryptic female choice and sexual arms races Exploring diverse reproductive adaptations from a theoretical and practical perspective The Evolution of Primary Sexual Characters will provide an unparalleled overview of sexual diversity in many taxa and an introduction to the issues in sexual selection that are changing our view of sexual processes

Evolution and the Problem of Natural Evil Michael Anthony Corey,2000 Is the evolutionary process intelligently designed If so why did the Creator choose such an evil infested means to create the biosphere What is the intrinsic nature of evil itself Is natural evil necessary Is evil compatible with the existence of God Will the world s evils ever be totally redeemed What place does humanity occupy in the cosmic scheme of things Evolution and the Problem of Natural Evil attempts to answer these and other timeless questions by proposing a bold new conceptual synthesis that aggressively marries the tenets of modern developmental psychology to the basic concepts of classical theism The end result of this novel approach is deeply encouraging insofar as it places the problem of evil as well as the general fate of human existence in a much larger and more

Cognition and Communication in the Evolution of Language Anne Reboul, 2017 This book proposes a new two step approach to the evolution of language whereby syntax first evolved as an auto organizational process for the human conceptual apparatus as a Language of Thought and this Language of Thought was then externalized for communication due to social selection pressures Anne Reboul first argues that despite the routine use of language in communication current use is not a failsafe guide to adaptive history She points out that human cognition is as unique in nature as is language as a communication system suggesting deep links between human thought and language If language is seen as a communication system then the specificities of language its hierarchical syntax its creativity and the ability to use it

to talk about absent objects are a mystery This book shows that approaching language as a system for thought overcomes these problems and provides a detailed account of both steps in the evolution of language its evolution for thought and its externalization for communication **New York School Journal** ,1899 **Biology, Medicine, and Surgery of Elephants** Murray Fowler,Susan K. Sternberg,James C. Kaufman,2013-06-17 How is one to understand the nature of intelligence One approach is through psychometric testing but such an approach often puts the cart before the horse the test before the theory Another approach is to use evolutionary theory This criterion has been suggested by a number of individuals in the past from Charles Darwin in the more distant past to Howard Gardner Stephen Gould Steven Pinker Carl Sagan David Stenhouse and many others The chapters in this book address three major questions 1 Does evolutionary theory help us understand the nature of human intelligence 2 If so what does it tell us about the nature of human intelligence 3 And if so how has intelligence evolved The goal of this book is to present diverse points of view on the evolution of intelligence as offered by leading experts in the field In particular it may be possible to better understand the nature and societal implications of intelligence by understanding how and why it has evolved as it has This book is unique in offering a diversity of points of view on the topic of the evolution of human intelligence *Encyclopedia of Animal Science - (Two-Volume Set)* Duane E.
