Animals in Primary Succession. The Role of Fauna in Reclaimed Lands. Edited by J. D. Majer. Cambridge University Press, Cambridge. 1989. 547 pp. ISBN 0 521 33400 4. Price: £60.00, \$100.00.

This publication examines the contribution which the soil fauna makes to reclamation technology. It describes how the presence of certain animals can assist or impede the process of ecosystem restoration and how reclamation may be designed to cater for the economically or aesthetically valuable species. The three fundamental activities of soil fauna are described as burrowing, which causes changes in the porosity of the soil; humification, through the ingestion and fragmentation of organic matter; and mixing, which involves the translocation of soil onto or near the surface, which may lead to a textural inversion of the soil profile. There are 19 contributions by different authors, divided into six parts -- a general introduction; functional aspects of the fauna; practical aspects of fauna and reclaimed land; case studies; a synthesis of the book; and a bibliography of fauna studies in reclaimed lands. It is a valuable addition to the literature on conservation ecology.

General Technical Report NE, 1980 *Advances in Soil Science*, 2012-12-06 Soil degradation is clearly one of the most pressing problems facing man kind A continuation of soil degradation will eventually lead to a loss in crop productivity even though fertilizers and other inputs often result in increased yields in the short term Soil degradation also leads to environmental pollution A decrease in soil quality invariably leads to a decrease in water quality and often in air quality While there is a clear consensus that soil degradation is a major problem the literature on this subject leaves numerous baffling questions If statistics on land degradation are correct there is a definite cause for concern and present a mammoth challenge for agricultural scientists There are those that say the scientific community has over dramatized this issue and created a credibility problem Consequently Volume 11 of *Advances in Soil Science* was organized by Dr Rattan Lal who is recognized as a leading authority on the subject The objective of Volume 11 was to assess the types and processes of soil degradation and establish some of the major cause effect relationships Volume II documented the seriousness of soil degradation in many parts of the world Therefore it seemed immediately important to devote a volume to the principles and technologies for restoring degraded soils to a productive status While the land resources are limited world population is rapidly increasing particularly in developing countries Dr

Walker,1999-12-17 As the human population inexorably grows its cumulative impact on the Earth s resources is hard to ignore The ability of the Earth to support more humans is dependent on the ability of humans to manage natural resources wisely Because disturbance alters resource levels effective management requires understanding of the ecology of disturbance This book is the first to take a global approach to the description of both natural and anthropogenic disturbance regimes that physically impact the ground Natural disturbances such as erosion volcanoes wind herbivory flooding and drought plus anthropogenic disturbances such as forestry grazing mining urbanization and military actions are considered Both disturbance impacts and the biotic recovery are addressed as well as the interactions of different types of disturbance Other chapters cover processes that are important to the understanding of disturbance of all types including soil processes nutrient cycles primary productivity succession animal behaviour and competition Humans react to disturbances by avoiding exacerbating or restoring them or by passing environmental legislation All of these issues are covered in this book Managers need better predictive models and robust data collections that help determine both site specific and generalized responses to disturbance Multiple disturbances have a complex effect on both physical and biotic processes as they interact This book provides a wealth of detail about the process of disturbance and recovery as well as a synthesis of the current state of knowledge about disturbance theory with extensive documentation *Grassland Invertebrates* Jim P. Curry,1993-11-30 Grasslands comprise more than a quarter of the Earth s land surface In addition to supporting a wide range of vertebrates such as domestic livestock and a variety of games species grassland is the natural habitat for a wide range of invertebrate species and this book considers those which occur in grassland and their impact on soil fertility and herbage growth It describes grassland as a habitat for invertebrates the groups which occur there and their abundance An extensive literature on grassland invertebrates scattered through numerous scientific journals and reports is drawn on in an attempt to develop an overview In the opening chapter the major grassland types are considered and the features which influence the distribution and abundance of the invertebrates which inhabit them are discussed Next the major taxonomic groups are reviewed in turn with a brief account of their biology and ecology and of their ecosystem role Some general features of grassland invertebrate communities are then described and the factors which influence the population densities of their constituent species are considered Particular attention is given to the ways in which populations are influenced by management practices The final and largest chapter deals with the various ways in which invertebrates influence important grassland processes through ingestion of organic matter interaction with injurious species is considered with particular emphasis on the potential for achieving this through manipulating grassland management practices U.S. Geological Survey Open-file Report ,1994 **Assessment of grassland ecosystem conditions in the southwestern United States**
