News article summary:

In a race for the development of a coronavirus vaccine, Russian vaccine developers have decided to bypass phase 3 of clinical trials. This would have involved testing the safety and effectiveness of the vaccine, named Sputnik V, on a large scale. Cockburn 2020 has collated information suggesting potential bioethical issues relevant to this scenario. This includes the potential danger of the vaccine on certain groups of people, such as the immunocompromised. Less than 200 people have been tested in stages 1 and 2 with no placebo comparison, so its effectiveness is difficult to judge. Using an adapted adenovirus strain to trigger immune responses, its long-term effect on the immune system may be different to what the vaccine developers have initially seen. However, they have observed effectiveness of the vaccine after its application in a patient followed by exposure. In addition, President Vladimir Putin has suggested the vaccine's mass production and offering it to healthcare workers. Providing healthcare workers with the vaccine first may allow for a larger healthcare workforce which may ultimately lead to many more lives saved. Vaccine development classically displays the need for risk analysis, however, the level of urgency in the midst of a pandemic leads to question whether it revokes the need for phase 3 when many lives are already on the line. So, is vaccine development acceleration acceptable, or even beneficial, when it may result in potential harm to people and the society?

Journal article 1 annotation:

In light of the recent outbreak of COVID-19, the vaccine industry has been subjected to an overwhelming urgency. In this article, Lurie *et al.* examined the different methods of vaccine-development technology in previous epidemics, to determine effective and efficient methods for the current pandemic and potential outbreaks. The authors established that DNA- and RNA- based platforms have the greatest potential for speed, as it employs synthetic processes. They also explain that, rather than following the conventional sequence of steps, many steps can be executed in parallel, to facilitate rapid vaccine-testing. However, there
