Phonological Representations John Coleman, 2005-11-24 Rewriting rules derivations and underlying representations is an enduring characteristic of generative phonology In this book John Coleman argues that this is unnecessary The expressive resources of context free Unification grammars are sufficient to characterize phonological structures and alternations According to this view all phonological forms and constraints are partial descriptions of surface representations This framework now called Declarative Phonology is based on a detailed examination of the formalisms of feature theory syllable theory and the leading varieties of nonlinear phonology Dr Coleman illustrates this with two extensive analyses of the phonological structure of words in English and Japanese As Declarative Phonology is surface based and highly restrictive it is consistent with cognitive psychology and amenable to straightforward computational implementation **Kenchreai Robert** Lorentz Scranton, University of Chicago, American School of Classical Studies at Athens, 1976 **Noise in Physical Systems and 1/f Fluctuations** Gijs Bosman, 2001 The International Conference on Noise in Physical Systems and 1 f Fluctuations brings together physicists and engineers interested in all aspects of noise and fluctuations in materials devices circuits and physical and biological systems The experimental research on novel devices and systems and the theoretical studies included in this volume provide the reader with a comprehensive in depth treatment of present noise research activities worldwide Contents Noise in Nanoscale Devices S Bandyopadhyay et al 1 f Voltage Noise Induced by Magnetic Flux Flow in Granular Superconductors O V Gerashchenko Low Frequency Noise Analysis of Different Types of Polysilicon Resistors A Penarier et al Low Frequency Noise in CMOS Transistors An Experimental and Comparative Study on Different Technologies P Fantini et al Modeling of Current Transport and 1 f Noise in GaN Based HBTs H Unlu Low Frequency Noise in CdSe Thin Film Transistors M J Deen NIST Program on Relative Intensity Noise Standards for Optical Fiber Sources Near 1550 nm G Obarski Physical Model of the Current Noise Spectral Density Versus Dark Current in CdTe Detectors A Imad et al Time and Frequency Study of RTS in Bipolar Transistors A Penarier et al Neural Network Based Adaptive Processing of Electrogastrogram S Selvan Shot Noise as a Test of Entanglement and Nonlocality of Electrons in Mesoscopic Systems E V Sukhorukov et al The Readout of Time Continued Fractions and 1 f Noise M Planat Longitudinal and Transverse Noise of Hot Electrons in 2DEG Channels J Liberis et al 1 f Noise Intermittency and Clustering Poisson Process F Gruneis Noise Modeling for PDE Based Device Simulations F Bonani Methods of Slope Estimation of Noise Power Spectral Density J Smulko and other papers Readership Researchers academics and graduate students in electrical and electronic engineering biophysics nanoscience applied physics statistical physics and semiconductor science **Noise In Physical Systems And 1/f Fluctuations: Icnf 2001, Procs Of The 16th Intl Conf** Gijs Bosman, 2001-08-20 The International Conference on Noise in Physical Systems and 1 f Fluctuations brings together physicists and engineers interested in all aspects of noise and fluctuations in materials devices circuits and physical and biological systems The experimental research on novel devices and systems and the theoretical

Transient Floating-Body Effects for Memory Applications in Fully-Depleted SOI MOSFETs Maryline Bawedin, 2007 Memory devices based on floating body effects FBE in Silicon on Insulator SOI technology are among the most promising candidates for sub 100nm and low power Dynamic Random Access Memory DRAM This new type of DRAMs called Zero Capacitor RAM Z RAM uses only one transistor in partially depleted PD SOI technology and takes advantage of FBE which have been considered as parasitic phenomena until now The Z RAM programming principles are based on the threshold voltage V_{TH} variations induced by the excess or lack of majority carriers in the floating body In this dissertation a new floating body effect the Transient Floating Body Potential Effect TFBPE based on the body majority carriers non equilibrium and on the dual dynamic gate coupling in standard fully depleted FD SOI MOSFETs is presented for the first time The TFBPE occurs in a specific gate bias range and can induce strong hysteresis of the gate and drain current characteristics although the FD SOI transistors are usually known to be immune against the FBE and their aftermaths Adapted from the same physics principles as in the drain current hysteresis that we called the Meta Stable Dip MSD effect a new concept of one transistor capacitor less memory was also proposed the Meta Stable DRAM MSDRAM which is dedicated for double gate operations All the experimental results and physics interpretations were supported by 2D numerical simulations A 1D semi analytical model of the body potential for non equilibrium states was also proposed For the first time this original body potential model takes into account the majority carriers density variations i e the quasi Fermi level non equilibrium versus a transient gate voltage scan in a FD MOS device
