topics and theory of AI are presented but it also includes practical information on data input reduction as well as data output i.e. algorithm usage. Because traditional AI concepts such as pattern recognition, numerical optimization and data mining are now simply types of algorithms, a different approach is needed. This sensor algorithm effecter approach grounds the algorithms with an environment, helps students and AI practitioners to better understand them and subsequently how to apply them. The book has numerous up to date applications in game programming, intelligent agents, neural networks, artificial immune systems and more. A CD ROM with simulations, code and figures accompanies the book.

Computer Games I David N.L. Levy, 2012-12-06. *Computer Games I* is the first volume in a two part compendium of papers covering the most important material available on the development of computer strategy games. These selections range from discussions of mathematical analyses of games to more qualitative concerns of whether a computer game should follow human thought processes rather than a brute force approach to papers which will benefit readers trying to program their own games. Contributions include selections from the major players in the development of computer games: Claude Shannon whose work still forms the foundation of most contemporary chess programs; Edward O Thorpe whose invention of the card counting method caused Las Vegas casinos to change their blackjack rules; and Hans Berliner whose work has been fundamental to the development of backgammon and chess games.
