DARWIN, 2025-03-28 Explore the groundbreaking insights of Charles Darwin in *The Variation of Animals and Plants under Domestication* Vol 1 Delve into Darwin's meticulous observations on the profound impact of domestication on the evolution of both animals and cultivated plants This volume examines the principles of variation heredity and breeding showcasing the powerful role of natural selection in shaping the characteristics of domesticated species A cornerstone of evolutionary biology this work offers a detailed exploration of the modifications induced by human intervention Darwin's detailed analysis illuminates the processes by which selective breeding leads to the vast array of forms and traits we observe in the animal and plant kingdoms Essential reading for anyone interested in the life sciences zoology and the history of scientific thought this classic text continues to resonate with its enduring relevance to our understanding of the natural world This meticulously prepared edition preserves the integrity of Darwin's original work This work has been selected by scholars as being culturally important and is part of the knowledge base of civilization as we know it This work is in the public domain in the United States of America and possibly other nations Within the United States you may freely copy and distribute this work as no entity individual or corporate has a copyright on the body of the work Scholars believe and we concur that this work is important enough to be preserved reproduced and made generally available to the public We appreciate your support of the preservation process and thank you for being an important part of keeping this knowledge alive and relevant **Variation in Animals and Plants, by H.M. Vernon ...** Horace Middleton Vernon, 1902 *The Variation of Animals and Plants Under Domestication* Charles Darwin, 2020-04-22 If animals and plants had never been domesticated and wild ones alone had been observed we should probably never have heard the saying that like begets like The proposition would have been as self evident as that all the buds on the same tree are alike though neither proposition is strictly true For as has often been

remarked probably no two individuals are identically the same All wild animals recognise each other which shows that there is some difference between them and when the eye is well practised the shepherd knows each sheep and man can distinguish a fellow man out of millions on millions of other men Some authors have gone so far as to maintain that the production of slight differences is as much a necessary function of the powers of generation as the production of offspring like their parents This view as we shall see in a future chapter is not theoretically probable though practically it holds good The saying that like begets like has in fact arisen from the perfect confidence felt by breeders that a superior or inferior animal will generally reproduce its kind but this very superiority or inferiority shows that the individual in question has departed slightly from its type The whole subject of inheritance is wonderful When a new character arises whatever its nature may be it generally tends to be inherited at least in a temporary and sometimes in a most persistent manner What can be more wonderful than that some trifling peculiarity not primordially attached to the species should be transmitted through the male or female sexual cells which are so minute as not to be visible to the naked eye and afterwards through the incessant changes of a long course of development undergone either in the womb or in the egg and ultimately appear in the offspring when mature or even when quite old as in the case of certain diseases Or again what can be more wonderful than the well ascertained fact that the minute ovule of a good milking cow will produce a male from whom a cell in union with an ovule will produce a female and she when mature will have large mammary glands yielding an abundant supply of milk and even milk of a particular quality Nevertheless the real subject of surprise is as Sir H Holland has well remarked 1 not that a character should be inherited but that any should ever fail to be inherited In a future chapter devoted to an hypothesis which I have termed pangenesis an attempt will be made to show the means by which characters of all kinds are transmitted from generation to generation
