The Publishers Weekly ,2002 Sampling Rare or Elusive Species William Thompson,2013-04-10 Information regarding population status and abundance of rare species plays a key role in resource management decisions Ideally data should be collected using statistically sound sampling methods but by their very nature rare or elusive species pose a difficult sampling challenge Sampling Rare or Elusive Species describes the latest sampling designs and survey methods for reliably estimating occupancy abundance and other population parameters of rare elusive or otherwise hard to detect plants and animals It offers a mixture of theory and application with actual examples from terrestrial aquatic and marine habitats around the world Sampling Rare or Elusive Species is the first volume devoted entirely to this topic and provides natural resource professionals with a suite of innovative approaches to gathering population status and trend data It represents an invaluable reference for natural resource professionals around the world including fish and wildlife biologists ecologists biometricians natural resource managers and all others whose work or research involves rare or elusive species

Psychopharmacology Handbook ,1965 Wildlife Study Design Michael L. Morrison,William M. Block,M. Dale Strickland,Bret A. Collier,Markus J. Peterson,2008-03-21 We developed the first edition of this book because we perceived a need for a compilation on study design with application to studies of the ecology conservation and management of wildlife We felt that the need for coverage of study design in one source was strong and although a few books and monographs existed on some of the topics that we covered no single work attempted to synthesize the many facets of wildlife study design We decided to develop this second edition because our original goal synthesis of study design remains strong and because we each gathered a substantial body of new material with which we could update and expand each chapter Several of us also used the first edition as the basis for workshops and graduate teaching which provided us with many valuable suggestions from readers on how to improve the text In particular Morrison received a detailed review from the graduate students in his Wildlife Study Design course at Texas A M University We also paid heed to the reviews of the first edition that appeared in the literature Quantitative Analyses in Wildlife Science Leonard A. Brennan,Andrew N. Tri,Bruce G. Marcot,2019-09-10 An authoritative guide to quantitative methods that will help wildlife scientists improve analysis and decision making Over the past fifty years wildlife science has become increasingly quantitative But to wildlife scientists many of whom have not been formally trained as biometricians computer modelers or mathematicians the wide array of available techniques for analyzing wildlife populations and habitats can be overwhelming This practical book aims to help students and professionals alike understand how to use quantitative methods to inform their work in the field Covering the most widely used contemporary approaches to the analysis of wildlife populations and habitats Quantitative Analyses in Wildlife Science is divided into five broad areas general statistical methods demographic estimation dynamic process modeling analysis of spatially based data on animals and resources numerical methods Addressing a variety of topics from population estimation

and growth trend predictions to the study of migration patterns this book presents fresh data on such pressing issues as sustainable take control of invasives and species reintroduction Authored by leading researchers in wildlife science each chapter considers the structure of data in relation to a particular analytical technique as well as the structure of variation in those data Providing conceptual and quantitative overviews of modern analytical methods the techniques covered in this book also apply to conservation research and wildlife policy Whether a quick refresher or a comprehensive introduction is called for *Quantitative Analyses in Wildlife Science* is an indispensable addition to every wildlife professional's bookshelf

Camera Traps in Animal Ecology Allan F. O'Connell, James D. Nichols, K. Ullas Karanth, 2010-10-05 Remote photography and infrared sensors are widely used in the sampling of wildlife populations worldwide especially for cryptic or elusive species Guiding the practitioner through the entire process of using camera traps this book is the first to compile state of the art sampling techniques for the purpose of conducting high quality science or effective management Chapters on the evaluation of equipment field sampling designs and data analysis methods provide a coherent framework for making inferences about the abundance species richness and occupancy of sampled animals The volume introduces new models that will revolutionize use of camera data to estimate population density such as the newly developed spatial capture recapture models It also includes richly detailed case studies of camera trap work on some of the world's most charismatic elusive and endangered wildlife species Indispensable to wildlife conservationists ecologists biologists and conservation agencies around the world the text provides a thorough review of the subject as well as a forecast for the use of remote photography in natural resource conservation over the next few decades

Modelling Population Dynamics K. B. Newman, S. T. Buckland, B. J. T. Morgan, R. King, D. L. Borchers, D. J. Cole, P. Besbeas, O. Gimenez, L. Thomas, 2014-07-16 This book gives a unifying framework for estimating the abundance of open populations populations subject to births deaths and movement given imperfect measurements or samples of the populations The focus is primarily on populations of vertebrates for which dynamics are typically modelled within the framework of an annual cycle and for which stochastic variability in the demographic processes is usually modest Discrete time models are developed in which animals can be assigned to discrete states such as age class gender maturity population within a metapopulation or species for multi species models The book goes well beyond estimation of abundance allowing inference on underlying population processes such as birth or recruitment survival and movement This requires the formulation and fitting of population dynamics models The resulting fitted models yield both estimates of abundance and estimates of parameters characterizing the underlying

processes **Bayesian Inference** William A Link, Richard J Barker, 2009-08-07 This text is written to provide a mathematically sound but accessible and engaging introduction to Bayesian inference specifically for environmental scientists ecologists and wildlife biologists It emphasizes the power and usefulness of Bayesian methods in an ecological context The advent of fast personal computers and easily available software has simplified the use of Bayesian and hierarchical models One obstacle remains for ecologists and wildlife biologists namely the near absence of Bayesian texts written specifically for them The book includes many relevant examples is supported by software and examples on a companion website and will become an essential grounding in this approach for students and research ecologists Engagingly written text specifically designed to demystify a complex subject Examples drawn from ecology and wildlife research An essential grounding for graduate and research ecologists in the increasingly prevalent Bayesian approach to inference Companion website with analytical software and examples Leading authors with world class reputations in ecology and biostatistics **Public Health Bibliography Series** United States. Antimicrobial Usage in Companion and Food Animals: Methods, Surveys and Relationships with Antimicrobial Resistance in Animals and Humans Miguel Ángel Moreno, Lucie Collineau, Carolee Anne Carson, 2020-03-30 **Methods For Monitoring Tiger And Prey Populations** K. Ullas Karanth, James D. Nichols, 2017-10-26 This book addresses issues of monitoring populations of tigers ungulate prey species and habitat occupancy with relevance to similar assessments of large mammal species and general biodiversity It covers issues of rigorous sampling modeling estimation and adaptive management of animal populations using cutting edge tools such as camera traps genetic identification and Geographic Information Systems GIS applied under the modern statistical approach of Bayesian and likelihood based inference Of special focus here are animal survey data derived for use under spatial capture recapture occupancy distance sampling mixture modeling and connectivity analyses Because tigers are an icons of global conservation in last five decades enormous amounts of commitment and resources have been invested by tiger range countries and the conservation community for saving wild tigers However status of the big cat remains precarious Rigorous monitoring of surviving wild tiger populations continues to be essential for both understanding and recovering wild tigers However many tiger monitoring programs lack the necessary rigor to generate the reliable results While the deployment of technologies analyses computing power and human resource investments in tiger monitoring have greatly progressed in the last couple of decades a full comprehension of their correct deployment has not kept pace in practice In this volume Dr Ullas Karanth and Dr James Nichols world leaders in tiger biology and quantitative ecology respectively address this key challenge They have collaborated with an extraordinary array of 30 scientists with expertise in a range of necessary disciplines biology and ecology of tigers prey and habitats advanced statistical theory and practice computation and programming practical field sampling methods that employ

technologies as varied as camera traps genetic analyses and geographic information systems The book is a tour de force of cutting edge methodologies for assessing not just tigers but also other predators and their prey The 14 chapters here are lucidly presented in a coherent sequence to provide tiger specific answers to fundamental questions in animal population assessment why monitor what to monitor and how to monitor While highlighting robust methods the authors also clearly point out those that are in use but unreliable The managerial dimension of tiger conservation described here the task of matching monitoring objectives with skills and resources to integrate tiger conservation under an adaptive framework also renders this volume useful to wildlife scientists as well as conservationists

Amphibian Ecology and Conservation C. Kenneth Dodd, 2010 Describes the latest methodologies used to study the ecology of amphibians throughout the world Each of the 27 chapters explains a research approach or technique with emphasis on careful planning and the potential biases of techniques Statistical modelling landscape ecology and disease are covered for the first time in a techniques handbook

Handbook of Ecotoxicology David J. Hoffman, Barnett A. Rattner, G. Allen Burton, Jr., John Cairns, Jr., 2002-11-13 Completely revised and updated with 18 new chapters this second edition includes contributions from over 75 international experts Also a Technical Review Board reviewed all manuscripts for accuracy and currency Focusing on toxic substance and how they affect the ecosystems worldwide the book presents methods for quantifying and measuring ecotoxicological effects in the field and in the lab as well as methods for estimating predicting and modeling in ecotoxicology studies This is the definitive reference for students researchers consultants and other professionals in the environmental sciences toxicology chemistry biology and ecology in academia industry and government

Modeling Demographic Processes in Marked Populations David L. Thomson, Evan G. Cooch, Michael J. Conroy, 2008-12-11 Here biologists and statisticians come together in an interdisciplinary synthesis with the aim of developing new methods to overcome the most significant challenges and constraints faced by quantitative biologists seeking to model demographic rates

Ecotoxicology of Amphibians and Reptiles Donald W. Sparling, Greg Linder, Christine A. Bishop, Sherry Krest, 2010-06-02 Building on the success of its popular predecessor the second edition of *Ecotoxicology of Amphibians and Reptiles* presents newly available findings on the species that are important environmental indicators This new edition covers nearly twice as many topics as the first including recent developments in the ecotoxicology of amphibians and reptil

Linking Habitat Quality to Population Dynamics for Conservation Decision Making David R. Breining, Doug P. Armstrong, Robert C. Lacy, James Nichols, 2025-04-09 Endangered Species Recovery planning is often based on predictions from population models Species recovery is contingent on habitat restoration including reduction of threats such as predators and parasites However population predictions are rarely linked to habitat management meaning that management cannot be easily guided by most formal decision making frameworks Predicted recovery trajectories may depend not only on the type and extent of restoration but also the timing For example populations may initially continue to decline as habitat restoration takes place and their genetic diversity might need to be

maintained during that process There is also often considerable uncertainty about the effectiveness of proposed management in improving habitat quality and the effects of those improvements on population growth rates of the species targeted for recovery We seek examples of approaches integrating habitat restoration and population dynamics to guide decision making One example is where population data e g occupancy and habitat dynamics e g transition probabilities between states are directly integrated into a statistical likelihood Another uses a metamodel to combine different interdisciplinary models e g population habitat disease predator prey to represent a more complex system integrating the flow of information and sequences of events among models Decision frameworks to enhance species recovery could include management of relatively natural areas but also more intensively managed areas such as zoos or fragmented landscape with minimal long term conservation potential for some species Decision frameworks will ideally include adaptive management i e re current decisions recognizing that conservation decisions often need to begin imminently and that delaying action is a decision We invite articles that include several of the following elements in the context of conservation decision making Explaining why it is important to consider animal or plant population and habitat dynamics together Case studies models or other demonstrations of how habitat and population dynamics should or can be linked Examples may include remnant populations but also recent or prospective translocations Explicit or decision making approaches including adaptive management for linking habitat and populations for conservation to guide conservation Showing how loss of genetic variation in small populations can affect decisions given the time needed to restore habitat reduced toxins introduced predators disease Showing how variation in population and habitats over time and or space are important for decisions about species recovery
