Subtelomeres Edward J Louis, Marion M Becker, 2013-12-18 New genes and diversity leading to adaptation and evolution are generated in special areas of genomes

One such area in all eukaryotic genomes and in those prokaryotes with linear chromosomes is the region near the ends of the chromosomes These telomere associated sequences or subtelomeres have different properties than the rest of the genome

and are one of the most exciting frontiers left in genomics This book provides a broad introduction to the field of

subtelomeres with detailed information from various fields and systems covering yeasts and fungi pathogens and parasites

plants insects humans and primates and bacteria with linear chromosomes Advances in the field as well as continuing

challenges are discussed throughout The mosaic nature of this collection and the everchanging perspectives reflect the

nature of subtelomeres themselves Unlike the core of most genomes which are conserved and stable over time subtelomeres

are dynamic and polymorphic so much so that generally no two individuals look alike in these regions The dynamic nature of

the region and the ability to change the copy number generate diversity and try novel combinations make it the evolutionary

tinker's toolbox In many organisms the genes found in the region are involved in dealing with the environment In yeasts

different gene families involved in sugar metabolism as well as clumping together are found in subtelomeres and differences

in the region may be the reason why some strains are good for baking others for brewing and why some are pathogenic In

fungal plant and animal pathogens many of the genes involved in virulence are found here In humans and primates there are

a number of gene families that vary between ends for example the diverse olfactory receptor genes Even in bacterial linear

chromosomes the region contains genes involved in adapting to their environments Perhaps the ultimate use of these regions is in parasites where they rapidly adapt and escape from host immune systems through dynamic changes to the proteins exposed to the host's defenses Such dynamic polymorphic structures are also found in plants and insects though it is not always clear what the function might be in some cases they take on the role of end maintenance The dynamic polymorphic nature of subtelomeres where many ends share segmental duplications is an exciting area for study but also presents a difficult challenge from the technical perspective

Production Practices and Quality

Assessment of Food Crops Ramdane Dris, S. Mohan Jain, 2007-05-08 We can not talk about commodity production without building up all the operations after harvest It is possible to market the products just after harvest but it is only possible in small quantities Postharvest handling is the ultimate stage in the process of producing quality fresh fruits and vegetables getting these unique packages of water fresh commodities to the supper table Fresh fruits and vegetables are susceptible to a number of postharvest disease and disorders and the postharvest operations are predominately aimed at maintaining harvest quality Every step in the handling chain can influence the extent of disease and quality of the stored product From planting to consumption there are many opportunities for bacteria viruses and parasites to contaminate produce or nutrient deficiency level causing physiological disorders Most of the storage rots are diseases that have originated in the field and have carried over onto commodities after harvest Physiological disorders also arise from poor handling between harvest storage and marketing Treatments have a direct effect on inactivating or outright killing germinating spores thus minimising rots Prestorage treatment appears to be a promising method of postharvest control of decay Pre or postharvest treatments of

commodities are considered as potential alternatives for reducing the incidence of diseases disorders desinfestation of quarantine pests and for preserving food quality Postharvest treatments lead to an alteration of gene expression and fruit ripening can sometimes be either delayed or disrupted

Thermal Biosensors/Bioactivity/Bioaffinity P.K. Bhatia,1999 The immobilized biocatalyst IMB is a key component of biotransformation systems that are used to transform substrates to desired products The improvement of biocatalyst properties has a direct influence on the overall effectiveness of the process based on the biotransformation The basic catalytic characteristics of biocatalyst that are followed include kinetic properties pH optima stability and inhibition The investigation of catalytic properties of immobilized enzymes is still a time consuming procedure and is not always simple In the 1980s a major effort was made to standardize the rules by which IMB is characterized The Working Party of EFB on immobilized biocatalysts has formulated principles of individual methods among them the requirement of kinetic characterization 1 It was recommended to use a packed bed reactor equipped with temperature control and with infinite flow circulation The system should be equipped with a post column unit to measure the time dependence of the product or substrate concentration 2 3 the most commonly used analytical methods being spectrophotometry chemiluminescence automatic titration bioluminescence chromatography polarimetry and biosensors based on the oxygen electrode There are two main drawbacks to the application of these methods 1 The need to vary the analytical principles depending on the chemical and physical chemical properties of analytes 2 In some cases mainly in the study of hydrolytic enzymes the natural substrate must be replaced by an artificial one that is chromolytic chromogenic chemiluminiscent bioluminiscent or fluorescent
