A Handbook of Global Freshwater Invasive Species Robert A. Francis, 2012-03-12 Invasive non native species are a major threat to global biodiversity Often introduced accidentally through international travel or trade they invade and colonize new habitats often with devastating consequences for the local flora and fauna Their environmental impacts can range from damage to resource production e.g. agriculture and forestry and infrastructure e.g. buildings road and water supply to human health They consequently can have major economic impacts It is a priority to prevent their introduction and spread as well as to control them Freshwater ecosystems are particularly at risk from invasions and are landscape corridors that facilitate the spread of invasives This book reviews the current state of knowledge of the most notable global invasive freshwater species or groups based on their severity of economic impact geographic distribution outside of their native range extent of research and recognition of the ecological severity of the impact of the species by the IUCN As well as some of the very well known species the book also covers some invasives that are emerging as serious threats Examples covered include a range of aquatic and riparian plants insects molluscs crustacea fish amphibians reptiles and mammals as well as some major pathogens of aquatic organisms The book also includes overview chapters synthesizing the ecological impact of invasive species in fresh water and summarizing practical implications for the management of rivers and other freshwater habitats

Evolution and the Human-Animal Drive to Conflict Jorge A. Colombo,2023-07-31 Evolution and the Human Animal Drive to Conflict examines how fundamental universal animal drives such as dominance prevalence survival kinship and profit greed advantage whether of material or social nature provide the basis for the evolutionary trap that promotes the unstable conflictive dominant prone individual and group human behaviours Examining this behavioural tension this book argues that while these innate features set up behaviours that lean towards aggression influenced by social inequalities the means implemented to defuse them resort to emotional and intellectual strategies that sponsor fanaticism and often reproduce the very same behaviours they intend to defuse In addressing these concerns the book argues that we should enhance our resources to promote solidarity accept cultural differences deter expansionist and uncontrolled profit drives and achieve collective access towards knowledge and progress in living conditions This entails promoting the redistribution of resources and creative labour access and avoiding policies that generate a fragmented world with collective and individual development disparities that invite and encourage dominance behaviours This resource redistribution asserts that it is necessary to reformulate the global set of human priorities towards increased access to better living conditions cognitive enhancement a more amiable interaction with the ecosystem and non aggressive cultural differences promote universal access to knowledge and enhance creativity and cultural convivence These behavioural changes entail partial derangement of our ancestral animal drives camouflaged under different cultural profiles until the species succeeds in replacing the dominance of basic animal drives with prosocial collective ones Though it entails a formidable task of confronting financial military and religious powers and cultural inertias human history is also a challenging continuous experience in these domains for the sake of our own self identity and self evaluation we should reject any suggestion of not continuing embracing slowly constructing collective utopias channelled towards improving individual and collective freedom and creativeness This book will interest academics and students in social cognitive and evolutionary psychology the neurosciences palaeoanthropology philosophy and anthropology

analyses the impact computerization has had on contemporary science and explains the origins technical nature and epistemological consequences of the current decisive interplay between technology and science an intertwining of formalism computation data acquisition data and visualization and how these factors have led to the spread of simulation models since the 1950s Using historical comparative and interpretative case studies from a range of disciplines with a particular emphasis on the case of plant studies the author shows how and why computers data treatment devices and programming languages have occasioned a gradual but irresistible and massive shift from mathematical models to computer simulations The Open Access version of this book available at <http://www.taylorfrancis.com> has been made available under a Creative Commons Attribution Non Commercial No Derivatives CC BY NC ND 4.0 license
