Photochemistry of Vision Herbert J.A. Dartnall,2012-12-06 Radiation can only affect matter if absorbed by it Within the broad range of 300 1000 nm which we call the visible light quanta are energetic enough to produce excited electronic states in the atoms and molecules that absorb them In these states the molecules may have quite different properties from those in their dormant condition and reactions that would not otherwise occur become possible About 80 % of the radiant energy emitted by our sun lies in this fertile band and so long as the sun s surface temperature is maintained at about 6000 C this state of affairs will continue This and the transparency of our atmosphere and waters have allowed the generation and evolution of life Before life began the atmosphere probably also transmitted much of the solar short wave radiation but with the rise of vegetation a new product oxygen appeared and this by a photochemical reaction in the upper atmosphere led to the ozone layer that now protects us from the energetic short wave quanta that once perhaps took part in the generation of life molecules Light is an ideal sensory stimulus It travels in straight lines at great speed and consequently can be made to form an image from which an animal can make true continuous and immediate assessments of present and impending events

Symposium** R. Alfieri,P. Solé,2012-12-06 Strychnine and

microtoxin were tested as possible antagonists of two putative inhibitory transmitters in the retina taurine and GABA. Strychnine was shown to antagonize the depressive action of taurine on the ERG b wave but it did not affect the depressive action of GABA. Conversely, microtoxin had no effect on the depressive action of taurine on the ERG b wave but it antagonizes to some extent the depressive effect of GABA. These data as well as those obtained through recording tectal evoked responses lead to the conclusion that taurine and GABA do not act in the same way in retinal inhibitory synaptic transmission.

Introduction to Psychological Science William J. Ray, 2021-07-19. Introduction to Psychological Science provides students with an accessible, comprehensive, and engaging overview of the field of scientific psychology. It expertly incorporates a variety of perspectives ranging from neuroscience to cultural perspectives at an introductory level. Ray brings together cutting edge research from traditional psychological literature to modern evolving perspectives and creates a unified approach by focusing on three core themes: Behavior and Experience, an analysis of behavior and experiences observed across a variety of everyday life situations; Neuroscience, an examination of psychological experiences through a neuroscience lens ranging from genetic/epigenetic to cortical networks as related to psychology; Evolutionary Human Origins, an exploration of broader scientific questions by examining psychological processes from the perspective of human and cultural history. Through these themes, the book delves into topics like social processes, psychopathology, stress and health, motivation and emotion, developmental sequences, and cognitive functions such as memory, learning, problem solving, and language. Throughout, it helps students to understand the nature of psychological science by addressing common myths and misconceptions in psychology, showing how psychological science can be applied to everyday life and how new research can be created. Additionally, this student-friendly book is packed with pedagogical features including concept checks to test reader knowledge, extensions features which show how to apply knowledge, and a comprehensive glossary. Reflecting the latest APA Guidelines concerning the essential elements of an introductory psychology course, this text is core reading for all undergraduate introductory psychology students.
