Seiler,Eugenio Vilanova,2012-12-06 Ultraviolet radiation a component of sunlight has been recognized by photobiologists dermatologists and oculists as a potential hazard for human health because of its genotoxic carcinogenic and immunotoxic properties Its effects on human health include the induction of skin cancers ocular damage and impairment of immunity to certain infections A few decennia ago it was demonstrated that UV photons can affect the activity of the immune system through interactions with the skin This means that UV not only changes normal cells into cancer cells but also permits the outgrowth of the UV transformed cells by depressing the immune system An intriguing question is what interactions between UV radiation and the skin initiates alterations in immune function in the exposed skin and systemically i e in other places than the exposed skin During the last 20 years many studies have been performed in order to investigate the immunosuppressive activities of UVB in laboratory animals and in human volunteers In particular effects of UVB radiation on resistance to tumours and skin associated infections have been examined In addition effects of UVB radiation on immune parameters such as contact hypersensitivity and delayed type hypersensitivity both type IV hypersensitivity reactions mixed lymphocyte reactions mixed skin lymphocyte reactions antigen presentation and numbers and function of Langerhans cells have been studied intensively The antigenicity of murine tumours which are caused by UVB radiation was one of the first items to be investigated Kripke 1974 Virtual, Augmented and Mixed Reality.
