Arithmetic Geometry over Global Function Fields Gebhard Böckle, David Burns, David Goss, Dinesh Thakur, Fabien Trihan, Douglas Ulmer, 2014-11-13 This volume collects the texts of five courses given in the Arithmetic Geometry Research Programme 2009 2010 at the CRM Barcelona All of them deal with characteristic p global fields the common theme around which they are centered is the arithmetic of L functions and other special functions investigated in various aspects Three

courses examine some of the most important recent ideas in the positive characteristic theory discovered by Goss a field in tumultuous development which is seeing a number of spectacular advances they cover respectively crystals over function fields with a number of applications to L functions of t motives gamma and zeta functions in characteristic p and the binomial theorem The other two are focused on topics closer to the classical theory of abelian varieties over number fields they give respectively a thorough introduction to the arithmetic of Jacobians over function fields including the current status of the BSD conjecture and its geometric analogues and the construction of Mordell Weil groups of high rank and a state of the art survey of Geometric Iwasawa Theory explaining the recent proofs of various versions of the Main Conjecture in the commutative and non commutative settings

Number Fields and Function Fields - Two Parallel Worlds Gerard B. M. van der Geer, BJJ Moonen, René Schoof, 2006-11-24 Ever since the analogy between number fields and function fields was discovered it has been a source of inspiration for new ideas and a long history has not in any way detracted from the appeal of the subject As a deeper understanding of this analogy could have tremendous consequences the search for a unified approach has become a sort of Holy Grail The arrival of Arakelov's new geometry that tries to put the archimedean places on a par with the finite ones gave a new impetus and led to spectacular success in Faltings hands There are numerous further examples where ideas or techniques from the more geometrically oriented world of function fields have led to new insights in the more arithmetically oriented world of number fields or vice versa These invited articles by leading researchers in the field explore various aspects of the parallel worlds of function fields and number fields Topics range from Arakelov geometry the search for a theory of varieties over the field with one element via Eisenstein series to Drinfeld modules and t motives This volume is aimed at a wide audience of graduate students mathematicians and researchers interested in geometry and arithmetic and their connections

Arithmetic and Geometry over Local Fields Bruno Anglès, Tuan Ngo Dac, 2021-03-03 This volume introduces some recent developments in Arithmetic Geometry over local fields Its seven chapters are centered around two common themes the study of Drinfeld modules and non Archimedean analytic geometry The notes grew out of lectures held during the research program Arithmetic and geometry of local and global fields which took place at the Vietnam Institute of Advanced Study in Mathematics VIASM from June to August 2018 The authors leading experts in the field have put great effort into making the text as self contained as possible introducing the basic tools of the subject The numerous concrete examples and suggested research problems will enable graduate students and young researchers to quickly reach the frontiers of this fascinating branch of mathematics

Number Theory in Function Fields Michael Rosen, 2013-04-18 Elementary number theory is concerned with the arithmetic properties of the ring of integers $\mathbb{Z}$ and its field of fractions the rational numbers $\mathbb{Q}$ Early on in the development of the subject it was noticed that $\mathbb{Z}$ has many properties in common with $A[t]$ the ring of polynomials over a finite field Both rings are principal ideal domains both have the property that the residue class ring of any non zero ideal is finite both rings have infinitely many prime elements and both

rings have finitely many units. Thus one is led to suspect that many results which hold for $\mathbb{Z}$ have analogues of the ring A . This is indeed the case. The first four chapters of this book are devoted to illustrating this by presenting for example analogues of the little theorems of Fermat and Euler, Wilson's theorem, quadratic and higher reciprocity, the prime number theorem and Dirichlet's theorem on primes in an arithmetic progression. All these results have been known for a long time but it is hard to locate any exposition of them outside of the original papers. Algebraic number theory arises from elementary number theory by considering finite algebraic extensions K of $\mathbb{Q}$ which are called algebraic number fields and investigating properties of the ring of algebraic integers $\mathcal{O}_K$ defined as the integral closure of $\mathbb{Z}$ in K . **Topics in the Theory of Algebraic**

Function Fields Gabriel Daniel Villa Salvador, 2007-10-10. The fields of algebraic functions of one variable appear in several areas of mathematics: complex analysis, algebraic geometry and number theory. This text adopts the latter perspective by applying an arithmetic-algebraic viewpoint to the study of function fields as part of the algebraic theory of numbers. The examination explains both the similarities and fundamental differences between function fields and number fields, including many exercises and examples to enhance understanding and motivate further study. The only prerequisites are a basic knowledge of field theory, complex analysis and some commutative algebra. The book can serve as a text for a graduate course in number theory or an advanced graduate topics course. Alternatively, chapters 1-4 can serve as the base of an introductory undergraduate course for mathematics majors while chapters 5-9 can support a second course for advanced undergraduates. Researchers interested in number theory, field theory and their interactions will also find the work an excellent reference. **Cohomological Theory of Crystals Over Function Fields** Gebhard Böckle, Richard Pink, 2009. This

book develops a new cohomological theory for schemes in positive characteristic p and it applies this theory to give a purely algebraic proof of a conjecture of Goss on the rationality of certain L -functions arising in the arithmetic of function fields. These L -functions are power series over a certain ring A associated to any family of Drinfeld A -modules or more generally of A -motives on a variety of finite type over the finite field $\mathbb{F}_p$. By analogy to the Weil conjecture, Goss conjectured that these L -functions are in fact rational functions. In 1996, Taguchi and Wan gave a first proof of Goss's conjecture by analytic methods à la Dwork. The present text introduces A -crystals which can be viewed as generalizations of families of A -motives and studies their cohomology. While A -crystals are defined in terms of coherent sheaves together with a Frobenius map in many ways they actually behave like constructible étale sheaves. A central result is a Lefschetz trace formula for L -functions of A -crystals from which the rationality of these L -functions is immediate. Beyond its application to Goss's L -functions, the theory of A -crystals is closely related to the work of Emerton and Kisin on unit root F -crystals and it is essential in an Eichler-Shimura type isomorphism for Drinfeld modular forms as constructed by the first author. The book is intended for researchers and advanced graduate students interested in the arithmetic of function fields and/or cohomology theories for varieties in positive characteristic. It assumes a good working knowledge in algebraic geometry as well as familiarity with homological

algebra and derived categories as provided by standard textbooks Beyond that the presentation is largely self contained

Arithmetic of L-functions Cristian Popescu,Karl Rubin,Alice Silverberg, Noncommutative Iwasawa Main Conjectures over Totally Real Fields John Coates,Peter Schneider,Sujatha Ramdurai,Otmar Venjakob,2012-10-19 The algebraic techniques developed by Kakde will almost certainly lead eventually to major progress in the study of congruences between automorphic forms and the main conjectures of non commutative Iwasawa theory for many motives Non commutative Iwasawa theory has emerged dramatically over the last decade culminating in the recent proof of the non commutative main conjecture for the Tate motive over a totally real p adic Lie extension of a number field independently by Ritter and Weiss on the one hand and Kakde on the other The initial ideas for giving a precise formulation of the non commutative main conjecture were discovered by Venjakob and were then systematically developed in the subsequent papers by Coates Fukaya Kato Sujatha Venjakob and Fukaya Kato There was also parallel related work in this direction by Burns and Flach on the equivariant Tamagawa number conjecture Subsequently Kato discovered an important idea for studying the K_1 groups of non abelian Iwasawa algebras in terms of the K_1 groups of the abelian quotients of these Iwasawa algebras Kakde s proof is a beautiful development of these ideas of Kato combined with an idea of Burns and essentially reduces the study of the non abelian main conjectures to abelian ones The approach of Ritter and Weiss is more classical and partly inspired by techniques of Frohlich and Taylor Since many of the ideas in this book should eventually be applicable to other motives one of its major aims is to provide a self contained exposition of some of the main general themes underlying these developments The present volume will be a valuable resource for researchers working in both Iwasawa theory and the theory of automorphic forms
