

Cryptology

1 Basic concepts

The word Cryptology comes from the Greek words *kryptos*, which means hidden and *logos*, which means word. It is the branch of science that deals with secret communications and information security and privacy. Mathematical techniques are investigated and developed to provide

- 1) **confidentiality** (the information is available only to those people who have the right to it)
- 2) **integrity** (the information is protected against illegal changes)
- 3) **authenticity** (the identity of partners (people, computers, programs) is possible to check)

Sender: Alice in the figure above, person, bank, ATM machine, computer, satellite, company,....

Receiver: Bob in the figure above, person, bank, ATM machine, computer, satellite, company,....

Plaintext is a message (clear text, original text, source text) that should be securely transmitted from the sender to the receiver.

Encryption is a process (a math function, an algorithm) by which the plaintext is transformed into a hidden "non understandable" message, called **ciphertext** or **cryptotext**.

Decryption is a process (a math function, an algorithm) by which the ciphertext is turned into its original plaintext.

A sender and a receiver communicate through communication channel (computer network, radio broadcast, mobile phone...). It is supposed that the channel is insecure (for example a computer network which is controlled by technicians, administrators etc.) Therefore, other, unauthorized people can control the network flow too.
