expansion by kernel Karhunen Loeve expansion generation of additional prior model by solving the pre image problem and generation of multiple posterior models by solving the post image problem We propose a robust solution for the pre image problem geologically constrained optimization which utilizes the probability perturbation method from the solution of the fixed point iteration algorithm Additionally we introduce a so called post image problem for obtaining the feature expansion of the true Earth by defining a distance as the difference in their responses The combination of geologically constrained optimization and the post image problem efficiently generates multiple posterior Earth models constrained to prior geologic information hard data and nonlinear time dependent data The proposed method provides a realistic uncertainty model for future prediction compared with the result of the rejection sampler We also propose a metric ensemble Kalman filter Metric EnKF which applies the ensemble Kalman filter EnKF to the parameterizations by the kernel KL expansion in metric space Metric EnKF overcomes some critical limitations of EnKF it preserves prior geologic information it creates a stable and consistent filtering However the results of Metric EnKF applied to various cases including the Brugge field scale synthetic reservoir show the same problem as with the EnKF in general that is it does not provide a realistic uncertainty model
