Long,M. E. Meek,2004-10-08 Chloroform is a clear colourless volatile liquid which is used in the production of refrigerants and as a fluoropolymer feedstock It may be released into the environment from chlorodifluoromethane plants and from pulp and paper mills using chlorine based chemicals for bleaching and disinfection purposes Chloroform is also the principal by product of water disinfectant processes It is estimated that the vast majority of chloroform emissions into the environment are natural in origin This publication part of a series from the International Programme on Chemical Safety evaluates the risk to human health and the environment posed by exposures to chloroform

Principles for Evaluating Health Risks to Reproduction Associated with Exposure to Chemicals P. Foster,World Health Organization,International Program on Chemical Safety,2001 Intended as a tool for use by public health officials research and regulatory scientists and risk managers this publication seeks to provide a scientific framework for the use and interpretation of reproductive toxicity data from human and animal studies It also discusses emerging methodology and testing strategy in reproductive toxicity The text focuses on approaches to assessing reproductive toxicity in males and females including sexual dysfunction and infertility and many aspects of developmental toxicity following both prenatal and postnatal exposure from conception to sexual maturation It is an overview of the major scientific principles underlying hazard identification testing methods and risk assessment strategies in human reproductive toxicity It also discusses the evaluation of reproductive toxicity data in the context of the extensive risk assessment methodology that has emerged over the past 10 15 years
