Polyurethane Foams Arnold A. Lubguban, Gerard G. Dumancas, Roberto M. Malaluan, Arnold C. Alguno, 2025-04-21 As global priorities shift towards sustainable resources there is a growing interest in alternatives to petroleum based raw materials for industrial polyurethane PU foam production Polyurethane foams PUFs produced from the reaction between a polyol a polymer with multiple hydroxyl groups and a diisocyanate are widely used for their versatility They range from flexible foams like those found in mattresses or furniture to rigid foams used for home insulation The market for PU foams is anticipated to grow due to rising demand for comfort Historically petroleum based polyols have been favored for their availability and versatility However as petroleum supplies dwindle with oil reserves projected to be exhausted by around 2052 the pressing need for sustainable alternatives is clear to sustain the PU industry Bio based substitutes such as polyols derived from palm soybean castor and sunflower oils have been extensively researched to replace the petroleum based polyol feedstock This book focuses on applying coconut oil derived polyols in polyurethane foam production offering a detailed examination of their potential benefits and associated difficulties The introductory chapter outlines the critical need for greener alternatives and emphasizes the significant role of coconut oil as a substitute for petroleum based polyols Subsequent chapters delve into the chemistry and synthesis of coconut oil derived polyols and polyurethanes providing insights into their properties and contributions to polyurethane formulations This book further provides an overview of how coconut oil's high saturation impacts the polyol production process and explores methods to overcome these challenges It bridges the gap between raw material science and practical applications using coconut oil in polymer studies It provides valuable information for researchers and industry professionals
