Geoff Kneale, 2008-02-02 The study of protein nucleic acid interactions is currently one of the most rapidly growing areas of molecular biology DNA binding proteins are at the very heart of the regulation and control of gene expression replication and recombination Enzymes that recognize and either modify or cleave specific DNA sequences are equally important to the cell Some of the techniques reported in this volume can be used to identify previously unknown DNA binding proteins from crude cell extracts Virtually all are capable of giving direct information on the molecular basis of the interaction the location of the DNA binding site the strength and specificity of binding the identities of individual groups on specific bases involved in binding the specific amino acid residues of the protein that interact with the DNA or the effects of protein binding on gross conformation and local structure of DNA The recognition of DNA sequences by proteins is a complex phenomenon involving specific hydrogen bonding contacts to the DNA bases direct readout and or interactions with the sugar phosphate backbone indirect readout The latter interactions can also be highly specific because of sequence dependent conformational changes in the DNA In addition intercalation of planar aromatic amino acid side chains between the DNA bases can occur most notably with single stranded DNA binding proteins Furthermore when bound many DNA binding proteins induce drastic structural changes in the DNA as an integral part of their function *The Molecular Biology of Insect Disease Vectors* J.M. Crampton, C.B. Beard, C. Louis, 2012-12-06 Only one generation ago entomology was a proudly isolated discipline In Comstock Hall the building of the Department of Entomology at Cornell University where I was first introduced to experimental science in the laboratory of Tom Eisner those of us interested in the chemistry of life felt like interlopers In the 35 years that have elapsed since then all of biology has changed and entomology with it Arrogant molecular biologists and resentful classical biologists might think that what has happened is a hostile take over of biology by molecular biology But they are wrong More and more we now understand that the events were happier and much more exciting amounting to a new synthesis Molecular Biology which was initially focused on the simplest of organisms bacteria and viruses broke out of its confines after the initial fundamental questions were answered the structure of DNA the genetic code the nature of regulatory genes and importantly as its methods became more and more generally applicable The recombinant DNA revolution of the 1970s the development of techniques for sequencing

macromolecules the polymerase chain reaction new molecular methods of genetic analysis all brought molecular biology face to face with the infinite complexity and the exuberant diversity of life Molecular biology itself stopped being an isolated discipline preoccupied with the universal laws of life and became an approach to addressing fascinating specific problems from every field of biology Technique ,1991 **Scientific and Technical Aerospace Reports** ,1983 Lists citations with abstracts for aerospace related reports obtained from world wide sources and announces documents that have recently been entered into the NASA Scientific and Technical Information Database **Hydrogen in Metals: vol. 2. ; vol. 3** ,1978
