Of Lists:

The Charm of a List Lucie Doležalová, 2009-01-14 Lists one of the most archaic literary genres stand behind many of our complex mental or rhetorical structures and they often influence the way we conceptualize the world even if we are unaware of it They seem plain but may conceal a complicated inner logic They are agrammatical but may tell a story Their basic features selection order and layout may be enough to give them enormous power by including they exclude by ordering they create a hierarchy by taking on particular physical aspects they place themselves into a specific context These and other issues are discussed in the present transdisciplinary volume collecting the best revised contributions to a workshop on lists held at the Center for Theoretical Study in Prague in November 2008 Each of the 13 articles by researchers from seven countries provides a case study on the subject of list The fields covered include late antique medieval and early modern history philology philosophy cognitive and computer science The contributors aim both at presenting particular cases specific lists or list types and at the same time at addressing methodological issues exploring the ways of researching lists in their particular disciplines formulating relevant research themes and questions contextualizing the subject Since theoretical discourse on lists has not been established yet this volume should be seen as a first step in the process showing the variety of possible research directions on a transdisciplinary level and raising interest in the topic which although it may seem a bit obscure at first has indeed a lot to offer

Introduction to Data Systems Thomas Bressoud, David White, 2020-12-04 Encompassing a broad range of forms and sources of data this textbook introduces data systems through a progressive presentation Introduction to Data Systems covers data acquisition starting with local files then progresses to data acquired from relational databases from REST APIs and through web scraping It teaches data forms formats from tidy data to relationally defined sets of tables to hierarchical structure like XML and JSON using data models to convey the structure operations and constraints of each data form The starting point of the book is a foundation in Python programming found in introductory computer science classes or short courses on the language and so does not require prerequisites of data structures algorithms or other courses This makes the material accessible to students early in their educational career and equips them with understanding and skills that can be applied in computer science data science data analytics and information technology programs as well as for internships and research experiences This book is accessible to a wide variety of students By drawing together content normally spread across upper level computer science courses it offers a single source providing the essentials for data science practitioners In our increasingly data centric world students from all domains will benefit from the data aptitude built by the material in this book

Distributed Computing Fethi A. Rabhi, Sergei Gorlatch, 2011-06-28 Patterns and Skeletons for Parallel and Distributed Computing is a unique survey of research work in high level parallel and distributed computing over the past ten years. Comprising contributions from the leading researchers in Europe and the US it looks at interaction patterns and their role in parallel and distributed processing and demonstrates for the first time the link between skeletons and design patterns. It focuses on computation and communication structures that are beyond simple message passing or remote procedure calling and also on pragmatic approaches that lead to practical design and programming methodologies with their associated compilers and tools. The book is divided into two parts which cover skeletons related material such as expressing and composing skeletons, formal transformation, cost modelling and languages, compilers and run time systems for skeleton based programming, design patterns and other related concepts applied to other areas such as real time embedded and distributed systems. It will be an essential reference for researchers undertaking new projects in this area and will also provide useful background reading for advanced undergraduate and postgraduate courses on parallel or distributed system design.
