Functional Neuroimaging in Exercise and Sport Sciences Henning Boecker, Charles H. Hillman, Lukas Scheef, Heiko K. Strüder, 2012-06-19 Regular physical exercise is associated with substantial health benefits Recent evidence not only holds for cardiovascular effects promoting physical health but also for the central nervous system believed to promote brain health Moderate physical exercise has been found to improve learning memory and attentional processing with recent research indicating that neuroprotective mechanisms and associated plasticity in brain structure and function also benefit Physical exercise is also known to induce a range of acute or sustained psychophysiological effects among these mood elevation stress reduction anxiolysis and hypoalgesia Today modern functional neuroimaging techniques afford direct measurement of the acute and chronic relation of physical exercise on the human brain as well as the correlation of the derived physiological in vivo signals with behavioral outcomes recorded during and

after exercise A wide range of imaging techniques have been applied to human exercise research ranging from electroencephalography EEG magnetoencephalography MEG near infrared spectroscopy NIRS magnetic resonance imaging MRI to positron emission tomography PET All of these imaging methods provide distinct information and they differ considerably in terms of spatial and temporal resolution availability cost and associated risks However from a multimodal imaging perspective neuroimaging provides an unprecedented potential to unravel the neurobiology of human exercise covering a wide spectrum ranging from structural plasticity in gray and white matter network dynamics global and regional perfusion evoked neuronal responses to the quantification of neurotransmitter release The aim of this book is to provide the current state of the human neuroimaging literature in the emerging field of the neurobiological exercise sciences and to outline future applications and directions of research

The Publishers' Circular and Booksellers' Record of British and Foreign Literature ,1891 **The Evolution of Rhythm Cognition: Timing in Music and Speech** Andrea Ravignani,Henkjan Honing,Sonja A. Kotz,2018-07-24 Human speech and music share a number of similarities and differences One of the closest similarities is their temporal nature as both i develop over time ii form sequences of temporal intervals possibly differing in duration and acoustical marking by different spectral properties which are perceived as a rhythm and iii generate metrical expectations Human brains are particularly efficient in perceiving producing and processing fine rhythmic information in music and speech However a number of critical questions remain to be answered Where does this human sensitivity for rhythm arise How did rhythm cognition develop in human evolution How did environmental rhythms affect the evolution of brain rhythms Which rhythm specific neural circuits are shared between speech and music or even with other

domains Evolutionary processes long time scales often prevent direct observation understanding the psychology of rhythm and its evolution requires a close fitting integration of different perspectives First empirical observations of music and speech in the field are contrasted and generate testable hypotheses Experiments exploring linguistic and musical rhythm are performed across sensory modalities ages and animal species to address questions about domain specificity development and an evolutionary path of rhythm Finally experimental insights are integrated via synthetic modeling generating testable predictions about brain oscillations underlying rhythm cognition and its evolution Our understanding of the cognitive neurobiological and evolutionary bases of rhythm is rapidly increasing However researchers in different fields often work on parallel potentially converging strands with little mutual awareness This research topic builds a bridge across several disciplines focusing on the cognitive neuroscience of rhythm as an evolutionary process It includes contributions encompassing although not limited to 1 developmental and comparative studies of rhythm e g critical acquisition periods innateness 2 evidence of rhythmic behavior in other species both spontaneous and in controlled experiments 3 comparisons of rhythm processing in music and speech e g behavioral experiments systems neuroscience perspectives on music speech networks 4 evidence on rhythm processing across modalities and domains 5 studies on rhythm in interaction and context social affective etc 6 mathematical and computational e g connectionist symbolic models of rhythmicity as an evolved behavior
