Combinatorial Optimization Alexander Schrijver, 2003-02-12

This book offers an in depth overview of polyhedral methods and efficient algorithms in combinatorial optimization. These methods form a broad coherent and powerful kernel in combinatorial optimization with strong links to discrete mathematics, mathematical programming and computer science. In eight parts various areas are treated, each starting with an elementary introduction to the area with short elegant proofs of the principal results and each evolving to the more advanced methods and results with full proofs of some of the deepest theorems in the area. Over 4000 references to further research are given and historical surveys on the basic subjects are presented.

Algorithm Theory - SWAT 2006 Lars Arge, Rusins

Freivalds, 2006-06-27. This book constitutes the refereed proceedings of the 10th Scandinavian Workshop on Algorithm

Theory SWAT 2006 held in Riga, Latvia, in July 2006. The proceedings include 36 revised full papers presented together with 3 invited papers addressing issues of theoretical algorithmics and applications in various fields including graph algorithms, computational geometry, scheduling, approximation algorithms, network algorithms, data storage and manipulation, combinatorics, sorting, searching, online algorithms, optimization, and more.

Network Analysis Ulrik Brandes, Thomas

Erlebach, 2005-02-02. Network is a heavily overloaded term so that network analysis means different things to different

people. Specific forms of network analysis are used in the study of diverse structures such as the Internet, interlocking directorates, transportation systems, epidemic spreading, metabolic pathways, the Web, graph, electrical circuits, project plans, and so on. There is, however, a broad methodological foundation which is quickly becoming a prerequisite for researchers and practitioners working with network models. From a computer science perspective, network analysis is applied graph theory. Unlike standard graph theory books, the content of this book is organized according to methods for specific levels of analysis: element, group, network, rather than abstract concepts like paths, matchings, or spanning subgraphs. Its topics therefore range from vertex centrality to graph clustering and the evolution of scale-free networks. In 15 coherent chapters, this monograph, like a tutorial book, introduces and surveys the concepts and methods that drive network analysis and is thus the first book to do so from a methodological perspective independent of specific application areas.

Combinatorial Methods and Models

Rudolf Ahlswede, 2017-06-30. The fourth volume of Rudolf Ahlswede's lectures on Information Theory is focused on

Combinatorics. Ahlswede was originally motivated to study combinatorial aspects of Information Theory via zero error codes; in this case, the structure of the coding problems usually drastically changes from probabilistic to combinatorial. The best example is Shannon's zero error capacity, where independent sets in graphs have to be examined. The extension to multiple access channels leads to the Zarankiewicz problem. A code can be regarded combinatorially as a hypergraph, and many coding theorems can be obtained by appropriate colourings or coverings of the underlying hypergraphs. Several such colouring and covering techniques and their applications are introduced in this book. Furthermore, codes produced by

permutations and one of Ahlswede's favourite research fields extremal problems in Combinatorics are presented. Whereas the first part of the book concentrates on combinatorial methods in order to analyse classical codes as prefix codes or codes in the Hamming metric, the second is devoted to combinatorial models in Information Theory. Here the code concept already relies on a rather combinatorial structure as in several concrete models of multiple access channels or more refined distortions. An analytical tool coming into play especially during the analysis of perfect codes is the use of orthogonal polynomials. Classical information processing concerns the main tasks of gaining knowledge and the storage, transmission and hiding of data. The first task is the prime goal of Statistics. For transmission and hiding data, Shannon developed an impressive mathematical theory called Information Theory which he based on probabilistic models. The theory largely involves the concept of codes with small error probabilities in spite of noise in the transmission which is modeled by channels. The lectures presented in this work are suitable for graduate students in Mathematics and also for those working in Theoretical Computer Science, Physics and Electrical Engineering with a background in basic Mathematics. The lectures can be used as the basis for courses or to supplement courses in many ways. Ph.D. students will also find research problems often with conjectures that offer potential subjects for a thesis. More advanced researchers may find questions which form the basis of entire research programs.

A Century of Excellence in Measurements, Standards, and Technology David R. Lide, 2018-02-06

Established by Congress in 1901, the National Bureau of Standards (NBS) is now the National Institute of Standards and Technology (NIST). NIST has a long and distinguished history as the custodian and disseminator of the United States standards of physical measurement. Having reached its centennial anniversary, the NBS/NIST reflects on and celebrates its first century with this book describing some of its seminal contributions to science and technology. Within these pages are 102 vignettes that describe some of the Institute's classic publications. Each vignette relates the context in which the publication appeared, its impact on science, technology, and the general public, and brief details about the lives and work of the authors. The groundbreaking works depicted include: A breakthrough paper on laser cooling of atoms below the Doppler limit which led to the award of the 1997 Nobel Prize for Physics to William D. Phillips. The official report on the development of the radio proximity fuse, one of the most important new weapons of World War II. The 1932 paper reporting the discovery of deuterium in experiments that led to Harold Urey's 1934 Nobel Prize for Chemistry. A review of the development of the SEAC, the first digital computer to employ stored programs and the first to process images in digital form. The first paper demonstrating that parity is not conserved in nuclear physics, a result that shattered a fundamental concept of theoretical physics and led to a Nobel Prize for T. D. Lee and C. Y. Yang. Observation of Bose-Einstein Condensation in a Dilute Atomic Vapor. A 1995 paper that has already opened vast new areas of research.
