Techniques in Mycorrhizal Studies K.G. Mukerji, C. Manoharachary, B.P. Chamola, 2013-03-14 The importance of mycorrhiza for the improvement of plant growth is increasingly being realised in Agriculture and Forestry and several mycorrhizal fungi have been commercially recognised for the purpose The aim of this book is to describe the various techniques used to study the mycorrhizal biology Problems with preparing such a book are many Mainly mailing of manuscripts to and from authors resulted in irregular and final editing Every effort was made not to change the peer review original manuscript to ensure accuracy Our sole aim is to communicate to the greatest extent possible a current world need in mycorrhizal research Plant productivity is regulated by microbial associations established in the plant root systems The interactions of microorganisms and plant roots are especially important in providing nutritional requirements of the plant and the associated microorganisms Plant growth and development are controlled largely by the soil environment in the root region rhizosphere This is a very complex environment in which the effects of the plant on soil microorganisms and the effects of microorganisms on the plant are interacting interdependent and highly complex Plant root exudates and breakdown products feed the microbes and the microbe in turn often benefit the plant Mycorrhizal fungi are important tools for increasing growth development and yield of economically important plants they play an important role of biofertilizer which can help establish plants in nutrient deficient soils particularly phosphorus deficient soils arid semi arid and waste lands

Mycorrhizal Biology K.G. Mukerji, B.P. Chamola, Jagjit Singh, 2012-12-06 The fundamental problem the world faces today is the rapidly increasing pressure of population on the limited resources of the land To meet the ever increasing demands of expanding populations agricultural production has been raised through the abundant use of inorganic fertilizers the adoption of multicropping systems and

liberal application of chemical pesticides fungicides bactericides etc Though the use of chemicals has increased the yield dramatically it has also resulted in the rapid deterioration of land and water resources apart from wastage of scarce resources This has adversely affected the biological balance and lead to the presence of toxic residues in food soil and water in addition to imposing economic constraints on developing countries From the Preface Mycorrhizal Biology addresses the global problem of land degradation and the associated loss of soil productivity and decline in soil quality caused by exploitative farming practices and poor management in developing countries and the far reaching socio economic and ecological consequences of its impact on agricultural productivity and the environment In the light of a need for sustainable development a new system of productive agriculture to ensure the efficient management of agricultural inputs for long term high crop productivity with minimum damage to the ecological and socio economic environment is essential The management of mycorrhizal fungi will form a significant part of such a system and this work investigates the key association of plant roots with mycorrhizal fungi known to benefit plants under conditions of nutritional and water stress and pathogen challenge and analyses the developments in our understanding of the genetic loci that govern mycorrhiza formation General Concepts in Integrated Pest and Disease Management A. Ciancio,K.G. Mukerji,2007-07-20 The proposal for this series originated during a short term visit of Professor Mukerji to the Plant Protection Institute of CNR at Bari Italy in November 2005 Both editors agreed on the need to produce a volume focusing on recent advances and achievements which changed the practice of crop protection in the last decade The opera rapidly evolved towards a long term editorial endeavour yielding a mul disciplinary series of five volumes In view of environmental and health concerns a determined effort is currently made in almost any agroecosystem in the world to reduce and rationalize the use of chemicals pesticides fungicides nematocides etc and to manage pests pathogens more effectively This consciousness is not only related to the need of nourishing a still growing world population but also derives from the impact of side effects of farming like soil water and environmental contamination calling for a responsible conservation of renewable resources There are increasing expectations at the producers and consumers levels concerning low inputs agriculture and residues free food Disciplines like IPM IDM integrated pest management integrated disease management are now central to the science and technology of crop protection In the classical version of IPM IDM a pesticide fungicide is applied only when the pathogen population reaches a level that would lead to economic losses in the crop In other words classical IPM IDM concentrates on reducing the numbers of noxious organisms through the application of agrochemicals *Microorganisms in Soils: Roles in Genesis and Functions* Francois Buscot,Ajit Varma,2007-01-04 Soils would not exist without the complex and heterogeneous activities of microorganisms For the third volume of Soil Biology an international board of renowned scientists shed light on the significant role of these organisms The following key topics are covered Microorganisms in bioerosion humification mineralization and soil aggregation Microbial energetics and microbes in biogeochemical processes such as carbon and

nitrogen cycles and phosphorus bio availability Interactions in the mycorrhizosphere e g between mycorrhizal fungi and bacteria Impact of microbes on plant nutrient cycling and the possible effects of transgenic rhizospheres on soil fungi Functions of microbes in specific soil compartments such as soil surface or toxic metal polluted soils Regulation of microbial activities in functional domains that are influenced by biotic or abiotic factors Use of marker genes and isotopes as examples for modern techniques in soil microbiology Mycorrhiza - Function, Diversity, State of the Art Ajit Varma, Ram

Prasad, Narendra Tuteja, 2017-05-11 This is the fourth updated and revised edition of a well received book that emphasises on fungal diversity plant productivity and sustainability It contains new chapters written by leading experts in the field This book is an up to date overview of current progress in mycorrhiza and association with plant productivity and environmental sustainability The result is a must hands on guide ideally suited for agri biotechnology soil biology fungal biology including mycorrhiza and stress management academia and researchers The topic of this book is particularly relevant to researchers involved in mycorrhiza especially to food security and environmental protection Mycorrhizas are symbioses between fungi and the roots of higher plants As more than 90% of all known species of plants have the potential to form mycorrhizal associations the productivity and species composition and the diversity of natural ecosystems are frequently dependent upon the presence and activity of mycorrhizas The biotechnological application of mycorrhizas is expected to promote the production of food while maintaining ecologically and economically sustainable production systems **Mycorrhiza** Ajit
